1 COUNCIL MEMBERS:

2 MIKE MADIGAN, Chairman

3 SUNNE McPEAK, Chairman

4 LESTER SNOW, Executive Director

5 ERIC HASSELTINE, Contra Costa Council

6 STEVE HALL, Association of California Water
7 Agencies

8 ALEX HILDEBRAND, South Delta Water Agency

9 RICHARD IZMIRIAN, California Sportfishing
10 Protection Alliance11 ROSEMARY KAMEI, Santa Clara Valley Water
12 District

13 DAVID GUY, California Farm Bureau Federation

14 TOM GRAFF, Environmental Defense Fund

15 JUDITH REDMOND, Community Alliance with Family
16 Farmers

17 ROBERTA BORGONOVO, League of Women Voters

18 ANN NOTTOFF, Natural Resources Defense Council

19 PIETRO PARRAVANO, Pacific Coast Federation of
20 Fishermen's Association

1 (All parties present, the following proceedings were
2 had at 8:00 a.m.)

3 CHAIRMAN McPEAK: I have listed on the
4 agenda for this morning the Chair's report and I
5 dearly hoped that that would be given by Mike
6 Madigan. It still might be given by Mike Madigan.
7 We still might see our Chairman.

8 All I wanted to do under this item is
9 reflect a little bit on the process of getting the
10 framework document in better shape. Yesterday we
11 were working on it and I said we needed to all think
12 about how we could improve upon that document. What
13 process would we use.

14 Lester and Steve and I chatted a little bit
15 last night about the timetable that they're working
16 on in refining, revising the document and when do we
17 next meet. And between now and September 10th, it
18 is likely that there will be two revisions or so to
19 the document.

20 Yesterday, Lester, we were talking about
21 probably the need to take the first part of that and
22 integrate it with at least the Attachment B, or take
23 Attachment B and integrate it into the document and
24 start reflecting in that framework document all of
25 the key issues that are delineating the CalFed

1 solution.

2 The principles, whatever we qualitatively
3 and quantitatively are setting as goals, objectives,
4 indicators, actions, and, you know, be able to take
5 the 2,000-plus pages and start bringing it down to
6 the guts of what we're making decisions on or trying
7 to accomplish and the actions within one document.

8 Having said that, I have a suggestion for
9 BDAC and I want to know if you think this makes
10 sense for providing the feedback for agreeing to
11 work off of a document that we kept trying to
12 change, revise, improve so that we have something
13 that we think reflects decisions that we're making
14 here and advice to the CalFed agencies. There are
15 perhaps three things at least that come to mind that
16 we could be doing.

17 The first I would like to invite each of us
18 individually to take the document as we have it
19 today and mark it up. If you can go beyond saying,
20 "Here's what I think is wrong" but drafting the --
21 proposing language that you want to see in it the
22 way it is structured, that would be most helpful
23 because staff is going to pretty soon -- pretty
24 immediately be working on the next stage, the next
25 generation of that document.

1 The second thing I want to ask is that the
2 work groups use that document to now start also
3 providing input from the perspective of the work
4 groups so that the sections that relate to the topic
5 and focus of the work group get reviewed in the work
6 group and the comments come back as to what should
7 be the changes, revisions, modifications in the
8 document.

9 And the third is that I would like to
10 encourage or commend to the caucuses that meet to
11 also use that document. I'm, you know, aware of at
12 least four that -- four caucuses that are having a
13 lot of ongoing discussion and dialogue.

14 There's the Environmental Water Caucus --
15 thank you for the reception last night -- there's
16 the Ag Caucus, there's the Urban Caucus, Ag and
17 Urban are also talking to each other and I guess
18 you're now also talking to Environmental, so that's
19 great, and the business community.

20 There may be yet other caucuses, I'm not
21 trying to limit how many caucuses get established,
22 you go do it, have a great time, but in your own
23 meetings where you are gathering, could we use the
24 document, get -- or use those forms as a way to get
25 input back on the document. And when I say "input,"

1 I really am talking about proposed language, what
2 you want to see in it, what is the answer, not just
3 what is the problem with the document, okay?

4 And then I had another thought about it
5 because I'm going to share with you how I am
6 approaching that document. You may not like this
7 approach but it works for me. I suggest that it's a
8 document in which we all bet that we're right and
9 that we're willing to bet that the other parties are
10 wrong because we've got some right now immutable
11 problems.

12 Now, what does it mean to bet that you're
13 right. If you make a bet, you are betting that
14 something that is observable either will or will not
15 happen. It's not an ideology, it's not a
16 philosophy. You know, either horse one or horse two
17 is going to win.

18 And so the way that I view these issues
19 when I've got a different position than Alex -- that
20 rarely happens, right -- is that, okay, let me tell
21 you what I think we should do, and if I'm right,
22 here's what we'll observe. But I'm going to allow
23 for the fact I'm wrong and Alex is right.

24 And so if that's true, we then go to Alex's
25 solution, always sort of taking an approach of what

1 is going to have the least damage or least impact on
2 the environment, the most optimization of the
3 efficient management practices, and allowing for the
4 fact that others may actually be right and I'm wrong
5 and therefore we opt then into their course of
6 action. Anyway, that's the constraint I'm using. It
7 sort of begins to clarify exactly how certain are we
8 about our position.

9 Having shared my own approach on this,
10 betting that we're right and allowing for the fact
11 that the other person is wrong, are you comfortable
12 with this notion of we draft or mark up the document
13 individually and send it back, okay. What about
14 working -- using it in work groups?

15 Martha, you -- okay. And just I would urge
16 the caucuses to do the same thing.

17 Martha, did you have a comment?

18 MS. DAVIS: Yes, she said that she was
19 going to get Ronnie to do the comments.

20 CHAIRMAN McPEAK: I think Ronnie should
21 all boycott you and force you -- I mean, you know,
22 Ronnie did the hard work of reading through it and
23 commenting on the document so that everybody can
24 either accept those or we can get sued.

25 Right now, what I'm suggesting is no, you

1 can't default to Ronnie's kind of work any longer.
2 You have to say what to do about it. That's the
3 distinction I'm making, okay?

4 Alex?

5 MR. HILDEBRAND: I agree with your
6 approach but thinking about the fact we don't have
7 another meeting for two months here and that things
8 need to move along, it's a question of how we move
9 it along during that period. And I would suggest
10 that we send in these comments as you suggest and
11 where the staff doesn't find any big conflict among
12 the comments from different parties, they might go
13 ahead and adopt it.

14 CHAIRMAN McPEAK: Yes.

15 MR. HILDEBRAND: Where they do see a big
16 conflict, they can then identify that and put it on
17 the agenda for discussion for the next meeting.

18 CHAIRMAN McPEAK: I like that very much.

19 And, of course, Alex sets the standard for
20 how prompt and how thorough the comments should be.
21 So everybody should do their homework like Alex.

22 Okay. I heard Steven and Mary say that
23 that's a good idea. We'll follow what you
24 suggested, Alex.

25 All right. We're now going to turn to the

1 fisheries.

2 Oh, yes, Tom.

3 MR. GRAFF: The joint release that the
4 Governor and the Secretary put out yesterday
5 mentioned a revised framework by the end of the
6 month. Should we -- will that be substantially
7 revised, in which case we wait or not substantially
8 revised, in which case we don't wait?

9 CHAIRMAN McPEAK: I would actually try
10 to get your comments in now because I think that
11 Lester is going to be revising it.

12 {?}: We had -- as you may know, we had
13 a CalFed policy group meeting Tuesday and Wednesday
14 of this week and we're getting comments from the
15 agencies by the close of business today. And so we
16 plan on trying to turn around the draft early next
17 week and incorporate what we've been getting from
18 the stakeholders as well as the agencies so we have
19 an updated version.

20 And actually, it was the intent of the
21 Secretary and the Governor to try to start drawing
22 the maximum attention to that revised document.
23 This document is still in pretty close circulation,
24 I mean, within the stakeholder community and I think
25 this next one we want to do a much larger

1 distribution of.

2 So I guess Tom -- there's kind of two
3 answers, two time frames, comments that people
4 already have, if we have those today and Monday, we
5 can incorporate them in. Otherwise, you'll probably
6 want to look at the draft. It will be available by
7 the end of the week. Probably the 24th.

8 CHAIRMAN McPEAK: Okay. Thank you.
9 Thanks for that question.

10 As I had told you, we shared with you
11 yesterday, we are expecting Mr. Cahill (phonetic)
12 from the Governor's office to be joining us. He'll
13 be here probably around 9:30. And so as we proceed
14 with the agenda, what we want to do is -- we may
15 very well be in the panel discussion by the time he
16 comes.

17 I just want to let the audience and the
18 panelists know that we will complete the
19 presentation from whomever is speaking on the panel
20 and then do, if you will, a suspend that, recess
21 that and -- for the time that we then take
22 Mr. Cahill and finish that and then go back with the
23 panel.

24 Lester and Steve and Mary, are we ready to
25 move to the report on the expert panel for

1 fisheries?

2 Yes. Okay. Then this agenda lists Ron Ott
3 (phonetic) and Pete Chadwick to do the report. Are
4 we going directly to them? Any further comments?

5 Okay. Thank you.

6 Mr. Ott and Mr. Chadwick, you're on.

7 MR. OTT: Good morning. Are we on now?

8 Thank you.

9 CHAIRMAN McPEAK: You're on now but
10 you're standing in front of your own overhead so
11 you --

12 MR. OTT: Right. Thanks.

13 Back when we put out the EIS draft,
14 EIS/EIR, and part of that was a Phase 2 report, in
15 that Phase 2 report there was a section on fisheries
16 that generated a lot of issues, brought a lot of
17 issues to light. And in the management policy and
18 in BDAC those issues were brought forward and it was
19 decided that we needed to get a special committee
20 together to start addressing these issues.

21 We did assemble a team in early January.
22 Representatives from the Fish and Wild Service,
23 Department of Water Resources, stakeholders like CVP
24 water users, they institute other stakeholders from
25 Metropolitan Water District. We had all the

1 agencies' representatives and a group of
2 stakeholders that had other stakeholders behind them
3 that were represented. And we had our first meeting
4 in the first part of February.

5 Of all the issues that were brought out in
6 the Phase 2 report -- there was a number of them --
7 there was about 20 questions that everybody would
8 love to have answers to. But they really boiled
9 down to three primary issues that they said that we
10 ought to address as soon as we can.

11 The first one is what species, populations,
12 their life stages, when and where in the Delta are
13 they impacted as a result of diversions. We need to
14 know that for each one of the alternatives from
15 no-action to Alternatives 1, 2 and 3 and of course
16 existing conditions.

17 The next thing they wanted to know is what
18 degree of benefit would we derive for these fish
19 species if -- from just the common programs alone.

20 And then the last one, the big question
21 is -- well, excuse me, Pete, stay on that one more
22 -- thank you.

23 The last question is what is the risk and
24 chances of success of recovery of these species with
25 the particular alternatives that we have. So that's

1 a big, big question.

2 And then they asked one more question --
3 Pete, go ahead, thank you -- is if they don't come
4 to recovery and we do still have major impacts with
5 these particular alternatives that we had in our
6 Phase 2 report, what modifications can you make
7 either structurally or operationally to these
8 alternatives where you could head towards
9 recoveries.

10 Next slide.

11 So this team got together and assembled,
12 and some of the basic assumptions they had to make
13 in order to perform their work in the time period
14 that we had and with the initial group that we had,
15 and those are important to bring out, the biological
16 scope, we couldn't address all species so we
17 addressed three major species of interest:

18 Four runs of salmon on the Sacramento
19 River, one run on the San Joaquin River, striped
20 bass and Delta smelt. We figured if we could get
21 through those, then we could -- then we could tackle
22 things like American shad, steelhead, sturgeon and
23 split tail.

24 So that's one of our limitations. We just
25 dealt with three primary species.

1 The other one is geographical scope. On
2 this first round, we just addressed ourselves in the
3 Delta and Suisun marsh area. We did not take on the
4 upstream benefits that we get from ERP, we did not
5 take on the downstream benefits that accrue from
6 actions that you make take on offshore. We limited
7 ourselves so we could get to an answer on geographic
8 scope and later on Pete Chadwick will get more into
9 that when you talk about our results.

10 Next slide, Pete.

11 Process. In the time period we had we used
12 the models and data that were right at our
13 fingertips and that people could bring in on the
14 table. So most of it was based on professional
15 judgment of people that have been involved in this
16 process for many years. Multiple sources of
17 uncertainty were certainly considered.

18 Biological processes, we're going to talk
19 about uncertainty a little bit later because you'll
20 see in our report that we have a lot of uncertainty,
21 but there's different types of uncertainty that will
22 be split out from that.

23 When we started to run this, we needed to
24 know where the water was going to go. So as you saw
25 in the Phase 2 report, we had the basic alternatives

1 and we had initial runs with operational constraints
2 and base case runs.

3 We used those as our first surrogate to
4 look at the impacts. So we only had one model run
5 for each alternative with no storage in it, one with
6 maximum storage which was 600 -- 6.2 million acre
7 feet. So that was -- that was the limitation. But
8 it would at least give us a starting point that we
9 can work from.

10 Next slide, Pete.

11 Common programs. We know there's a lot of
12 benefit for common programs. Exactly where that
13 habitat is going to be placed, given a certain
14 alternative, was not clear at this time. We
15 clarified it a lot more so we have a lot of
16 uncertainty of the value of the habitat at a certain
17 location and exactly where is it.

18 So for this first run, as you'll see later
19 on, we factored more into the ERP stuff from where
20 we're going from now on so this -- we're going to
21 try to minimize the uncertainty here.

22 Water quality. We know we have a lot of
23 effects of like metals coming down the Sacramento
24 River, pesticides, herbicides coming down the river
25 systems that go into the Delta, what are the

1 long-range effects on fisheries of these. So we
2 actually started working with the Water Quality
3 Committee to actually give this a bigger, a more
4 in-depth analysis. But that was a limitation of the
5 studies you saw.

6 And, of course, exotic species, we have a
7 lot of exotic introduced species in the Delta itself
8 but this team I thought was the important conclusion
9 that they reached, they said, no matter that we do
10 have newer species and they will alter the estuary,
11 we do not see exotic species, how they're introduced
12 making a difference in the way we evaluate these
13 alternatives against each other.

14 That's a big -- that's a conclusion I
15 thought was pretty pronounced. We don't see the
16 difference between them changing. It could change
17 the whole system but it doesn't change the
18 difference.

19 Go on, Pete.

20 Thank you.

21 A report that you have in your packet we
22 have sent that about three weeks ago to the American
23 Fishery Society. They are reviewing that with a,
24 what they call an anonymous panel. They did the
25 same thing on the Columbia River system for Columbia

1 River salmon for the five-state compact which
2 basically says they'll review and tell us did we use
3 logic in how we put this together, were there other
4 models other places that would have really helped us
5 get to this answer better, and what do we do with
6 the information as we have it now. What's the range
7 of certainty and uncertainty.

8 And they're going to give us their input on
9 that and that will be available by your next
10 meeting. And who will come to do that is Paul
11 Brohaw, the executive director of the American
12 Fishery Society, will come and give that report to
13 you of how he sees this report by then.

14 Go ahead, Pete.

15 So our process, how did we go about doing
16 this. We're called the DEF team now. You notice we
17 started off being the Diversion Effects on Fisheries
18 team. We couldn't make up an acronym for that so
19 now we're just the DEF group. And you'll see later
20 on the policy gave us a charge so now we call it the
21 Policy Depth Charge.

22 So we started off, how do we -- how do we
23 go about doing this. And what we -- we had a lot of
24 consideration of all the factors that would impact
25 the species and life stages, and here's a listing of

1 them, a lot of them:

2 Entrainment, how the water flows and the
3 patterns of flows in the Delta. The predation level
4 on each one of the species. Once we -- if we
5 salvage them, how do we handle them. What's the
6 food supply that's provided by each alternative or
7 what food supply is limited by each alternative.

8 Things that came out of the ERP, like
9 shallow-water habitat, water quality we talked
10 about, we didn't address that except for the
11 salinity, as you'll see, salinity component. And
12 agricultural diversions which were mostly diversions
13 that are in the common programs. And then we have
14 issues of strain, which you'll see a little bit
15 later.

16 To give you a sample of what the teams did,
17 I'm not going to go through this matrix, but this is
18 just Alternative 2 from the smelt point of view for
19 a wet year. The variables that we talked about
20 here, hydrodynamics. When they did the
21 hydrodynamics, they looked at the cross Delta flow,
22 the Q west, (inaudible) river flow at Bacon,
23 Sacramento River flow and San Joaquin River flow.
24 And then they rolled it up into a hydrologic's
25 judgment.

1 And what this basically says, we don't have
2 to read the numbers, but red is bad and deep purple
3 is blue -- what's the name of that character?
4 Barney --

5 CHAIRMAN McPEAK: Barney.

6 MR. OTT: Everybody wants Barney 'cause
7 they want it all to be purple. So we'll think about
8 it.

9 So we went through this for the wet years
10 and you can see up here we still have a lot of
11 impacts for Delta smelt for Alternative 2 in this
12 whole area, but they're really pronounced in May,
13 June and July.

14 Go to the next one.

15 You go to a drier period when the smelt
16 move up further up in the Delta, are more dispersed,
17 you'll see that we even get more entrainment effects
18 and it even turns more red, but it also turns -- we
19 get more benefit out of the agricultural screening
20 diversions that we've done in the common programs.

21 So between wet and dry, the wet -- the dry
22 period gets better because we get better, more
23 positive benefits from screening when the smelt move
24 up to where all the screens area, than we did over
25 the wet period.

1 CHAIRMAN McPEAK: Ron, Eric has a
2 question.

3 MR. HASSELTINE: On those last two
4 graphs, the difference between the yellow, orange
5 and red is some subjective view of the difference in
6 impact?

7 MR. OTT: That's -- that's good, Eric.
8 Each team was allowed to figure out what -- zero was
9 no change or no impact. So if it was red -- if it
10 got deeper towards the red, it says it had negative
11 impacts over no change and when it went to the blue,
12 it said it had a positive benefit over no change.

13 Now, what that zero is was addressed
14 differently by each team. The salmon team just
15 said, "It's relative how we feel about the fish as
16 they are now." The striped bass team said, "We'll
17 set zero on their first round, we'll set it back to
18 pre-project conditions."

19 So we let each team do that and as you see,
20 when Pete talks about it, we said "That was great
21 that you did this on this individual basis but now
22 we got to roll it up so they're all consistent and
23 make sense." And we're moving into that.

24 But we let each team, to answer your
25 question, Eric, we let them set what zero is and

1 what the change from that particular base was.

2 MR. HASSELTINE: Okay. Now, but you've
3 got numbers on there, too.

4 MR. OTT: Yes.

5 MR. HASSELTINE: And -- first of all, I
6 don't know what the significance of the numbers is,
7 but does it mean that a minus three is three times
8 worse than minus one, and if so, on what scale?

9 MR. OTT: It's -- let's -- let us agree
10 if I can answer that a little when we roll them
11 up --

12 MR. HASSELTINE: Fine.

13 MR. OTT: -- or else we'll be addressing
14 each team --

15 MR. HASSELTINE: That's fine. I just
16 want to make sure that I understand as we go along.
17 Because the last time we had this presentation there
18 were some very subjective bar charts where
19 significant differences were being shown between the
20 different alternatives, and the conclusions were
21 that therefore because of these bar charts, one was
22 better than the other but you don't know how much
23 better.

24 MR. OTT: Yeah, that was --

25 MR. HASSELTINE: And you don't know what

1 the magnitude of the overall difference really is
2 and how to factor the fish diversion issue in with
3 all the other issues that affect the alternatives.

4 MR. OTT: Okay.

5 MR. HASSELTINE: So I mean at some point
6 we need to know whether the fish are driving this
7 whole thing or whether they're just another factor
8 of equal issue to take into account.

9 MR. OTT: On this -- on this first case
10 that we let them set their absolute scales, it
11 usually ran from about minus three to plus seven.
12 But if we can when Pete gets into it, he'll actually
13 put definition to that.

14 MR. HASSELTINE: Okay.

15 MR. OTT: What that rate -- we're always
16 wondering what the bottom of it is, what the top of
17 it is and what the differential between the numbers
18 are.

19 Next slide, Pete.

20 They got -- some groups got pretty fancy I
21 thought. This was Alternative 2 where you took
22 Alternative 2 and you subtract -- you got the
23 Alternative 2 with the common programs and you
24 subtract it out the existing condition. So this was
25 the benefit that you would see of Alternative 2.

1 And as I mentioned before, if you just
2 looked at this particular bar diagram, you'd see in
3 wet years we had a lot of benefits, especially
4 March, April, May, June for smelt from just the ag
5 diversion screening. We also had more food supply
6 source from the common programs in the months of
7 April, May and -- March, April and May.

8 In the dry periods the food source was
9 better because the fish are back up where we're
10 doing most of the ERPP work, plus we had a lot more
11 diversions because the fish are moving up where --
12 they're in an area of impact diversion so the
13 alternative did more good there.

14 So taking that as just as an example of
15 what one team did, what I'd like Pete to do is this
16 ominous task of taking results of each one of these
17 teams, bringing them together so we can look at all
18 three of them at the same time.

19 Pete.

20 MR. CHADWICK: So I'll be doing that and
21 then following up with discussion of where we're
22 going from here in this effort.

23 First of all, I've got several slides here
24 that are sort of broad summaries of benefits and
25 detriments associated with each alternative in

1 relation to a no-action. The primary effect of this
2 is to cancel out differences in flow because with
3 the single operation studies that we have, if you go
4 back to the Phase 2 report, there is not much
5 difference in flows in the system, total flow,
6 between the no-action and the various alternatives.

7 So in Alternative 1 there are benefits from
8 the common programs, we can come back to more detail
9 on that.

10 Also, there are benefits from the improved
11 fish screens in the South Delta. The -- each of the
12 alternatives involves replacing the screens at the
13 state and federal facilities with state-of-the art
14 screens so there's some significant benefits that
15 vary by species in Alternative 1.

16 For Alternative 2, the benefits in general
17 are from the common programs again and from the
18 improved fish screens in the South Delta.

19 Third, there are some significant
20 improvements associated with the fact that in the
21 San Joaquin part of the system there are better flow
22 conditions downstream in the mouth of the Mokelumne
23 with Alternative 2.

24 On the negative side with Alternative 2,
25 there are consequences associated with reducing

1 flows below Hood in the Sacramento River. There are
2 consequences associated with the fact that there are
3 now fish screens at Hood on the Sacramento River.
4 The -- and for Sacramento salmon, for example, while
5 those screens are expected to have very high
6 efficiency, you're exposing a much larger fraction
7 of the population to those screens with a low impact
8 but nevertheless cumulatively, there's a concern
9 about the effectiveness or the consequences of those
10 screens.

11 There are concerns with Alternative 2 about
12 increased entrainment of fish along the eastern side
13 of the Delta with that amount of water being --
14 that's being taken that way and -- I made a mistake
15 when I was reading this quickly. The fourth point
16 is really the entrainment losses.

17 The second point pertains to another aspect
18 of the screens there; that is, at the Hood diversion
19 with Alternative 2, there will be fish screens.
20 Behind the fish screens there will be a pumping
21 plant and there will be thousands of upstream
22 migrants of the various species that will be
23 migrating up the San Joaquin River, up the Mokelumne
24 to this -- the back end of these screens, and we've
25 got to get them past there. And the teams felt that

1 that was a significant issue.

2 Going on to Alternative 3, again we have
3 the benefits of the common programs and the improved
4 fish screens in the South Delta. Now instead of
5 improved flows only below the Mokelumne River and
6 the San Joaquin side of the Delta, there are
7 improved flows throughout the San Joaquin Delta.
8 And then there's a major consequence of
9 approximately 80 percent reduction in exports from
10 the South Delta.

11 The detriments are two that carry over from
12 Alternative 2. The reduced flows below Hood and the
13 entrainment losses of the Hood fish screen are to
14 all intents and purposes equal between
15 Alternatives 2 and 3 so it carries over as a
16 detriment in Alternative 3.

17 If we go on -- and we have summarized the
18 various matrices that are in your report and in a
19 table that is not included in your report, and let
20 me describe this.

21 First of all, to set the stage, coming back
22 to Eric's question, what is the significance of
23 these numbers. The -- as Ron pointed out, the
24 matrices were somewhat different for the different
25 species because of assumptions made by the

1 individual groups. So at this point in time, we
2 went back and set existing conditions in all of the
3 alternatives to zero. So zero means abundance is
4 likely to be similar to existing conditions.

5 And then we scaled up and down from that
6 and asked the teams to define their perception of
7 the consequences of the different levels of pluses
8 and minuses.

9 Minus one to minus three, we end up
10 describing as decreases in abundance are likely, and
11 that's obviously opposite to the effect of the goals
12 of the CalFed program.

13 Alternatives 1 and 2, small increases in
14 abundance at best, unlikely to achieve CalFed
15 program goals.

16 Plus three to plus five, increase in
17 abundance likely. May achieve program goals.

18 Plus six or seven, highly likely to achieve
19 the goals of restoration and recovery that CalFed
20 has.

21 One more qualification that I need to make,
22 and that is that you can't make comparisons up and
23 down the chart among species for exist -- because
24 existing conditions differ. They are -- let me
25 illustrate with Delta smelt.

1 The analysis indicates that under existing
2 conditions, the conditions for Delta smelt are
3 substantially worse in dry years than in wet years.
4 But when you set both existing conditions to zero,
5 that gives you the illusion that, you know, that
6 they're the same. You've canceled out that
7 difference. So this chart is designed to get
8 comparisons going across alternatives and not across
9 species.

10 I want to point out several significant
11 conclusions from this chart. One is that the common
12 programs are viewed by each -- were viewed by each
13 of the teams to produce what we would call
14 significant benefits but not getting anywheres near
15 the kind of goals that we are seeking in CalFed by
16 themselves.

17 And before I go further on that point, let
18 me -- let me emphasize one of the qualifications
19 that Ron pointed out, and that is, we're talking
20 only about conditions in the Delta and Suisun Bay
21 here. This does not -- the common programs will
22 have any number of activities going on upstream and
23 to some extent downstream in the Delta and Suisun
24 Bay, and those effects are not included in this
25 analysis. And we'll come back to that in a minute.

1 You can see that Alternative 1 -- okay, let
2 me also point that each of the alternatives has the
3 common programs as part of them. So when you look
4 at Alternative 1, it indicates that you're not
5 gaining much in rela- -- if at all, and in some
6 cases you're going backwards from the common
7 programs.

8 Alternative 2 tends to go -- tends to go
9 down in relation to the common programs. In other
10 words, you're losing ground with Alternative 2.

11 With Alternative 3, you're making
12 significant incremental benefits for San Joaquin
13 salmon, Delta smelt and striped bass but you're not
14 making additional incremental benefits for salmon on
15 the Sacramento system, in the opinion of the teams.
16 That is a different kind of conclusion than has been
17 reached in relation to Alternative 3 before.

18 It tends to be a function of two things:
19 One is that the team placed more emphasis on the
20 significance of reductions in the flow below Hood on
21 the survival of salmon, smelts migrating down the
22 Sacramento River.

23 And one of the other differences in
24 relation to a historical analysis is that
25 historically the -- we expected the Delta cross

1 channel to be open frequently during the period when
2 salmon are migrating downstream. Now we have
3 achieved a substantial degree of protection for
4 salmon by closing the Delta cross channel during
5 most of the downstream migration period for salmon.
6 So you're comparing no diversion with a screen
7 diversion and that is less favorable.

8 Going on to -- what's next?

9 Okay. The population analysis issue, as we
10 described we're analyzing conditions in the Delta
11 and Suisun Bay. For Delta smelt that's basically
12 it. You know, they live in that area, they're not
13 migrating out of it so what you see is what you get
14 as far as the analysis and it applies to the whole
15 of the CalFed program and the accomplishments of it.

16 For striped bass, this is somewhat less so.
17 There are issues about striped bass behavior in the
18 ocean, for example, and how that relates to the
19 fishery. So there are some striped bass issues
20 outside of the Delta and Suisun Bay.

21 For salmon it's a huge issue. Obviously,
22 salmon have to be able to spawn upstream in the
23 Delta. There are lots of conditions upstream that
24 are affecting them. The CalFed program has a major
25 emphasis on improving conditions upstream. There

1 are substantial issues about the ocean fishery, both
2 recreational and commercial that are -- the program
3 is committed to considering and addressing.

4 So we have to get over that issue before we
5 get done with this process. We are adding people to
6 the team to start looking at that issue. It's a
7 substantial effort. We're attempting to deal with
8 that by October. So you're going to see a couple
9 more months where you're looking at the -- not
10 having an integrated consequence of the CalFed
11 program across the board for salmon.

12 Local peer review. There's a team of
13 people that's put this together but there are a lot
14 of other people around in the community that have
15 not participated in the process that we're seeking
16 input from, both within the agencies and outside of
17 the agencies. Ron already mentioned the AFS peer
18 review.

19 The most significant next step, though, is
20 optimizing the alternatives.

21 If you go to the next chart. Let's see, we
22 pointed out that these analyses were based on a
23 single operation study of the alternatives as
24 they're described in the Phase 2 report. We are
25 going to be looking at both changes in the structure

1 of the alternatives and changes in operations.

2 We've put together a team of people that
3 includes the Delta -- the team that has been working
4 on it with input from Fish Facilities Team, Water
5 Quality. The no-name group is an internal acronym
6 for a group that's working on operations analyses
7 primarily related to water supply, but there are
8 fisheries people on it to interact so that those
9 water supply augmentations take into account
10 fisheries' consequences. The operations folks from
11 the projects as well as the modelers would need to
12 have input into this.

13 And the -- the first charge that the policy
14 folks have given us is to develop a through-Delta
15 alternative that optimizes the benefits and
16 minimizes impacts -- and minimizes impacts to
17 fisheries while considering water supply and water
18 quality, to develop specific actions that would be
19 included in Stage 1 implementation.

20 I would point out here that you're looking
21 at the July 8th draft that has a list of specific
22 actions for Stage 1. The diversion effects team and
23 the no-name group are being asked to examine that
24 list as -- in relation to our total charge and come
25 back with recommendations relative to that list.

1 Then we would evaluate, do implementation based on
2 CalFed's contingent strategy which is described in
3 the July 8th paper on staging.

4 Indicated we would consider operational
5 changes. This is a list of potential ones, it's not
6 intended to be all-inclusive but you can see the
7 kinds of things we would be looking at.

8 Structural changes, hydraulic barriers,
9 changes in points of diversions, the South Fork
10 Mokelumne route, various things related to the
11 Clifton Court Forebay issue, storage options.

12 And then the common programs we've again
13 mentioned we've got to consider upstream actions,
14 particularly related to the ERP. Making changes,
15 it's within our purview and expectation that we are
16 free and expected to make proposals for changing the
17 common programs if we feel that's appropriate.

18 We've got -- let's see, the specific
19 charges, yeah.

20 As a result of the policy meeting Tuesday
21 and Wednesday it became more specific in the charge
22 that -- and it is now defined as follows:

23 To develop one or more best through-Delta
24 options for fisheries while considering water
25 supply, interacting with the other groups that are

1 involved in this process, include both operational
2 and structural actions, determining the ability of
3 the options to recover species within Delta actions.

4 The general reaction of the policy group
5 people was that we weren't achieving high enough
6 benefits with the -- in the analysis that's already
7 been run. That's why we're going back to do this.
8 And, as I pointed out, we're adding experts on
9 upstream issues.

10 Develop a list of in-Delta actions for
11 Stage 1. So in addition to looking at the
12 long-term, we're charged with coming up with
13 specific actions in Stage 1 to include in the
14 document.

15 Step 2 is to repeat the process basically
16 for through-Delta conveyance that is -- on a
17 contingency basis -- for dual. Pardon me, I
18 misspoke.

19 And then finally, determine the risk on
20 potential success of species recovery for the
21 through-Delta and contingent dual conveyances,
22 considering all the actions in the CalFed program,
23 i.e., integrating the upstream and downstream
24 actions with Delta actions.

25 Roughly, we're talking about targets of

1 doing the first stage, the first set of that
2 assignment in a month, the through-Delta -- or the
3 dual conveyance the following month, and this being
4 a target for October.

5 Are there questions of Ron or myself?

6 CHAIRMAN McPEAK: Roberta, and then Ann.

7 MS. BORGONOVO: When you take a look at
8 the charts and you see the negative effect of
9 through-Delta, are you actually looking at a
10 different configuration for through-Delta than
11 Alternative 2?

12 MR. CHADWICK: We will be considering
13 different, you know, physical differences. We're
14 also considering operational differences. The --
15 you know, some of the -- you know, one of the most
16 obvious ones, for example, in the operation studies
17 that were run, the -- there were no provisions for
18 curtailment at Hood, which has always been the
19 accepted way to protect young striped bass coming
20 down the Sacramento River.

21 There are, you know, many other operational
22 issues like that that need to be considered. So
23 that the -- the initial operations studies were, as
24 they were at Phase 2, they did not consider some of
25 these specific fishery needs. So there's a lot of

1 issues like that too, Roberta.

2 MS. BORGONOVO: And looking at the
3 matrix, it also looked as if in all of the
4 alternatives, storage really is not only not a lot
5 of help but a detriment.

6 Can you just comment on that?

7 MR. CHADWICK: Yeah.

8 MS. BORGONOVO: Did I read that right?

9 MR. CHADWICK: We -- the only team that
10 explicitly analyzed that was the salmon team. And
11 what was being looked at there was the consequences
12 in the Delta of changes in flow or diversions
13 resulting from the maximum amount of storage CalFed
14 is conceding -- considering.

15 So it was an all-or-nothing, and this did
16 not address upstream issues, just in-Delta, what
17 kind of changes in flow or diversions were seen as a
18 result of that and these operation studies and then
19 an estimate of what the consequences were.

20 It's a little -- from that aspect it's
21 somewhat misleading because it was looked in a --
22 there was an additional piece in the analysis and
23 that was the ERP flows which weren't tied to a
24 specific source, and there were some benefits
25 attributed to the ERP flows because of the changes

1 that they made in flow. And those aren't really
2 integrated.

3 How much of that would come from storage as
4 opposed to some other source such as water transfers
5 or something like that, wasn't -- isn't resolved at
6 this stage so there's a -- but basically, as you
7 store more water, if you're not releasing it to the
8 Delta at times that it's helpful to fish in the
9 Delta, you have the potential of causing adverse
10 effects. And that's what you're seeing.

11 MS. BORGONOVO: One last question. Did
12 you read the X2 standard where it is now in the
13 water quality standards for all of the model runs?

14 MR. CHADWICK: Yes.

15 CHAIRMAN McPEAK: Ann?

16 MS. NOTTOFF: As you went through there,
17 you acknowledged the fact that the analysis is
18 limited just to the Delta and Suisun Bay. And then
19 -- but then I noticed -- and that there were
20 upstream and downstream consequences and issues that
21 had not been integrated into this analysis.

22 But then when you went through the next
23 steps and the type of actions you're considering and
24 even the policy charge, I noticed -- it seemed that
25 you were expanding actions there to deal with

1 upstream issues, but I didn't see any kind of
2 corresponding expansion of your analysis to include
3 downstream Bay and ocean, either putting experts on
4 your panels or looking at that.

5 How do you --

6 MR. CHADWICK: The intent is to include
7 that.

8 MS. NOTTOFF? Oh, it is? Because your
9 slides just say upstream experts.

10 MR. CHADWICK: Okay. I'll fix it.

11 MS. NOTTOFF: They don't say Bay
12 experts.

13 MR. CHADWICK: Okay. The -- some of
14 the -- some of the people that are involved on the
15 team are fairly familiar with Bay issues. Probably,
16 Ann --

17 (End of tape)

18 MR. CHADWICK: -- will be -- this is a
19 pretty general analysis, we're not getting into
20 site-specific analyses.

21 The degree to which we need to add
22 additional people for that I think remains to be
23 resolved, but the charge includes considering the
24 whole of the CalFed actions. If we end up
25 concluding we need some additional people to bring

1 in, we'll do that.

2 We're not -- let's see, to some extent what
3 we're doing is we develop a specific issue where we
4 have a specific information need or a specific kind
5 of recommendation for actions and farm that out to
6 individuals or several individuals, and have them
7 provide the input back rather than adding all -- you
8 know, everybody to the -- to the -- involving them
9 in the whole exercise. So we may end up reaching
10 out for some Bay issues in that fashion also.

11 CHAIRMAN McPEAK: I think it would help
12 clarify to see, you know --

13 MR. CHADWICK: Yes, fair enough.

14 CHAIRMAN McPEAK: -- what you've taken
15 into account in the next phase to explicitly state
16 that you're looking at Bay and ocean.

17 MR. CHADWICK: I agree. That's a good
18 point.

19 CHAIRMAN McPEAK: Okay. I've got
20 Pietro, Alex, Richard and then Martha.

21 Pietro.

22 MR. PARRAVANO: Thank you, Sunne.

23 In that matrix there, did you take into
24 account under the Sacramento River salmon any
25 recovery plans for the endangered species?

1 MR. CHADWICK: We -- let's see, there
2 are provisions in the -- in the plan that are
3 incorporated in the existing operations studies, so
4 to a degree the answer to that is yes.

5 The analysis for the Sacramento salmon, we
6 attempted to integrate the needs of all four runs,
7 you know, consider when we're making a decision
8 about how good this plan is in October, for example,
9 we consciously went through and said, "Okay, well,
10 what's winter run doing, what's spring run," et
11 cetera, and we tried to integrate it into an -- into
12 one estimate.

13 Obviously, when it comes down to a
14 management standpoint, this program is eventually
15 going to have to be subjected to individual analysis
16 on each of those runs, particularly for the
17 endangered species. That is part of the charge that
18 the policy people have given us in relation to the
19 whole of -- the effect over the whole of the salmon
20 population and the Delta smelt population is, what
21 are the implications for Endangered Species Act.

22 And there will be -- that will be -- that
23 is -- so that also will be a consideration during
24 this next round where maybe some of these
25 operational -- you know, we're getting into more

1 detailed operational considerations and, certainly,
2 some of those operational considerations that we put
3 forward will be -- have in mind specific needs of
4 the various endangered species.

5 MR. PARRAVANO: It would seem like that
6 would change the matrix if, once you undertake
7 certain -- undertake the recovery plans, it would
8 change the numbers on that matrix --

9 MR. CHADWICK: Yeah. The -- the general
10 implication of this -- of this analysis is that
11 based on what CalFed would -- let's see, if we just
12 did what the operation studies provide for now and
13 what the physical -- what physically is provided in
14 the CalFed program in the Delta, you're not going to
15 achieve the recovery goals.

16 And that's part of what this analysis says
17 and part of what the policy people said, you know,
18 that's not going to be acceptable. We've got to go
19 further than that and we've got to consider some of
20 those specific needs, and so on, to get better
21 results.

22 MR. PARRAVANO: I guess what I'm hearing
23 is that we have two parallel approaches. One is to
24 implement recovery plans for the endangered species,
25 which will take us to a certain end result. And

1 then we've got a parallel program called CalFed
2 which might fall short --

3 MR. CHADWICK: Well --

4 MR. PARRAVANO: -- of that end result.

5 MR. CHADWICK: Yeah. No, that -- those
6 will be integrated. Yeah, definitely -- definitely
7 are going to be integrated. I mean the directors of
8 Fish and Game, Fish and Wildlife and NIMS are
9 sitting on the CalFed policy program and, you know,
10 they're going to insist on that integration
11 occurring in this program.

12 MR. PARRAVANO: Okay.

13 CHAIRMAN McPEAK: Alex.

14 MR. HILDEBRAND: I think we are seeing
15 here a lot of progress on a very complex and
16 difficult subject and Pete and Ron need to be
17 complimented along with their collaborators on this.

18 I do have a few questions. You've
19 indicated that where you go from here includes
20 analyzing the changes in the alternatives that would
21 improve them. I think some of us would like to have
22 the opportunity to work with you on what those
23 changes are that you're examining as you go along
24 rather than have you come back to us at some two
25 months from now and say, "Here's the alternative

1 that we analyzed."

2 The -- Ron mentioned at the beginning that
3 you decided that exotics would not change the
4 relation among alternatives. I don't particularly
5 question that but if you take Delta smelt, for
6 example, and if the exotics are a substantial impact
7 on Delta smelt, then the direction of benefit to
8 Delta smelt might be the same as you depicted here
9 but the magnitude might be greatly reduced. And
10 also, the feasibility of recovering the Delta smelt
11 might be greatly reduced.

12 So I think we need to have some analysis of
13 that question as to, in other words, you start out
14 with your diversion being a major consideration but
15 if diversion is not the dominant consideration in
16 respect to recovery of Delta smelt, then we should
17 recognize that.

18 MR. CHADWICK: I -- I agree with you. You
19 know, I agree with you a hundred percent. You're
20 asking for what -- the consequence that you
21 hypothesized that you might not reach recovery of
22 one group or another because of exotics, you know,
23 I've got to agree with. From past discussions, I'm
24 sure you'll appreciate that our feeling is it's
25 going to be very, very difficult to reach those

1 conclusions, but an analysis --

2 MR. HILDEBRAND: I appreciate it being
3 very difficult but whatever we can do is better than
4 not trying I think.

5 MR. CHADWICK: And it's certainly
6 important to acknowledge that, Alex, I agree.

7 MR. HILDEBRAND: Yeah.

8 Then another thing I'm interested in seeing
9 is what mechanisms you have in mind for getting the
10 upstream migrants past the screens in Sacramento.

11 It isn't quite clear to me why you can't --
12 why you can't just intermittently open that up and
13 let those fish go through. In the state of nature
14 you just see the upstream migrants accumulate at the
15 base of a small stream and wait for a flush that can
16 permit them to go on up. And it would seem to me
17 you could do the same thing here.

18 Now, I'm no expert on that --

19 MR. CHADWICK: Right.

20 MR. HILDEBRAND: -- and presumably
21 you've got an answer to it, but I think I'd like to
22 see just what mechanisms you have had in mind and
23 why they won't work pretty well.

24 MR. CHADWICK: There -- there are
25 specific mechanisms in mind, some of them going --

1 undergoing fairly detailed engineering and
2 biological analysis right now. The -- and the fish
3 facility technical team is telling us, "We can solve
4 this problem."

5 The biologist, the more general biologist
6 or the biologist that, let's say, is an expert on
7 salmon tends to look at that conclusion with some
8 degree of skepticism --

9 MR. HILDEBRAND: Uh-huh.

10 MR. CHADWICK: -- you know, based on
11 experience like Red Bluff diversion dam, the kind of
12 concerns that are actually being raised about the
13 Montezuma salinity control structure where the
14 structure is open all the time on outgoing tides,
15 and yet some of the salmon biologists are arguing
16 that they believe that there's some adverse
17 consequences of delays there.

18 And we're talking about here something
19 that's really at the heart of the migratory runs of
20 these fishes. We're talking about thousands of
21 them. You know, and it's not a couple hundred fish,
22 it's tens or hundreds of thousands. And so the
23 issue is -- you know, the issue is not -- is not
24 trivial.

25 But it is being analyzed and we'll -- when

1 the -- we'll see as the analysis gets further along
2 what degree of comfort that provides to the teams.

3 MR. HILDEBRAND: I'm certainly no expert
4 on this but I can see that the situation here is
5 quite a bit different from the ones you described
6 and would appear to me to be easier, so I think we
7 on the BDAC might like to be better informed on
8 that.

9 And I guess what you're telling me is this
10 may be a problem, it may not.

11 MR. CHADWICK: I think that every one of
12 the biologists that were on these evaluation teams
13 is convinced that it's a problem. The technical
14 fish facility people are telling us, "We can solve
15 it." And whether we can get to the point where the
16 analysis has gotten to the point that it gives a lot
17 of comfort to the teams remains to be seen.

18 MR. HILDEBRAND: Uh-huh.

19 MR. CHADWICK: But we can certainly
20 share the analysis and I'm sure that if you want,
21 you know, specifically to get better informed, we
22 can do that, certainly.

23 MR. HILDEBRAND: Thank you.

24 CHAIRMAN McPEAK: We have -- this is a
25 very important issue, very important, so we're

1 spending more time on it than the agenda allowed.

2 But I've got three more people and I do want to take
3 them and then we'll just conclude this component of
4 the agenda.

5 Richard, Martha and then Ryan.

6 Richard.

7 MR. IZMIRIAN: A major intervening
8 variable on the Bay and Delta -- rather on the Delta
9 and Suisun Bay is food supply. That is allegedly
10 dependent on water management and diversion effects.
11 That could have a key impact on these populations
12 that you're talking about.

13 Primary productivity, the nutrients turning
14 into a (inaudible) point and blooms, the production
15 of plankton and how that might affect these
16 populations. I don't see that in here at all.

17 MR. CHADWICK: Yeah, that --

18 MR. IZMIRIAN: To what extent is that
19 going to be considered in this analysis?

20 MR. CHADWICK: Okay. If you go back --
21 if you go -- if you look at the individual matrices,
22 that is included in the detailed analysis for each
23 species. And each of the teams did the best they
24 could in judging how that would be affected by just
25 flows and that kind of thing as well as by the

1 common programs.

2 And, for example, the Delta smelt team felt
3 that the primary value of the common programs from
4 the Delta smelt standpoint was not their physical
5 utilization of the habitat that would be created by
6 the shallow-water habitat in the marshland, and so
7 on like that, but the indirect effect of creating
8 increased productivity, both the primary and
9 secondary, and the benefits of that.

10 So they -- the benefits that they
11 attributed to the common programs they reached the
12 conclusion were due to these indirect effects on
13 food supply, not the direct effects of the smelt
14 utilizing that habitat because they felt that smelt
15 would not utilize that habitat directly themselves
16 to any significant degree.

17 So it is in there. It's a couple of levels
18 down and kind of not obvious but that was considered
19 by each of the teams.

20 CHAIRMAN McPEAK: Martha?

21 MS. DAVIS: First I'd like to agree with
22 Alex that this is an impressive amount of work. I
23 want to thank the team for all the time and energy
24 they've put into this.

25 I have two questions at this point: One

1 is, in the modeling, were the requirements of the
2 CVPIA included?

3 MR. CHADWICK: Yes. Let's see,
4 there's -- there are some qualifications to that.
5 There's some pieces of the CVPIA program that
6 they're -- they're still working on how to
7 incorporate in the models but -- so that not all of
8 the changes are reflected in the models so there's
9 some difficulty there.

10 But the principle is that they are to be
11 included to the extent that those have been agreed
12 to and are being implemented and it's -- it is
13 expected to be part of the baseline.

14 MS. DAVIS: So (inaudible) requirements?

15 MR. CHADWICK: Let's see, Mark isn't
16 here, is he?

17 Yeah. I don't remember the answer to that
18 analysis, Martha. We can get that for you. The
19 modelers I guess are not here today.

20 MS. DAVIS: Okay.

21 The other question I had is I noticed in
22 the written report that as this information was
23 being put together, there was also some effort to
24 assess the level of uncertainty coming up --

25 MR. CHADWICK: Yeah.

1 MS. DAVIS: -- with these numbers.

2 How did -- how did -- did you in preparing
3 this presentation, did you take the -- how did you
4 integrate the level of uncertainty that is reflected
5 in the numbers in the report itself?

6 MR. CHADWICK: Okay. This does not
7 integrate in uncertainty. These -- these are just
8 the point estimates that were made. In the report
9 there is uncertainty. I frankly feel that it's not
10 a very satisfactory treatment of that subject.
11 There is a lot of uncertainty with each of these
12 alternatives and with the common programs.

13 I participate in the salmon team so I can
14 more easily -- most easily describe what the salmon
15 team did. The salmon team basically felt that
16 existing conditions, we know basically what's there.
17 And we don't know a lot of the whys. So for the
18 uncertainty value the salmon team were describing
19 were the uncertainty associated with what the
20 probable consequences are, not the whys of, which is
21 another different nature of uncertainty.

22 The common programs, there are quite
23 significant uncertainties about not only how the
24 programs will be implemented but what -- you know,
25 what would be done in those programs but there are

1 real uncertainties about the consequences of
2 increasing shallow-water habitat. How much does it
3 benefit salmon, there's just not a lot of guide on
4 that. So there's an increment of uncertainty there.

5 And then any of the alternatives that
6 involve substantially changing the Delta, i.e.,
7 Alternatives 2 and 3, there's another big increment
8 of uncertainty. And the uncertainty numbers
9 reflected that. The striped bass and salmon -- the
10 striped bass and Delta smelt teams largely said any
11 of these changes are just really highly uncertain
12 for all of the alternatives in the common programs
13 and most everything they assigned the highest level
14 of uncertainty to.

15 It's clearly an issue. There's -- you
16 know, that doing nothing is certain to be
17 unsatisfactory, I think we can all agree. But when
18 it comes to how confident can we be of levels of
19 benefit, there's -- from these big changes there's a
20 lot of uncertainty biologically. There's just no
21 question about it.

22 CHAIRMAN McPEAK: Okay. Thank you.

23 Ryan.

24 {?}RYAN: Ever so briefly, Pete and Ron
25 thanks for a presentation that has evolved over the

1 last three or four weeks and I think raised a lot of
2 interesting issues and questions.

3 But Pietro's question related to the
4 endangered species biological opinions on the main
5 stem of Sacramento and the recovery issue, there was
6 kind of an -- in developing this matrix and
7 understanding this fish team did start in February,
8 it was kind of a dual-fold approach in terms of
9 establishing isolation as it related to -- and not
10 isolation in terms of conveyance, but the isolation
11 of the Delta as a complex, its limiting factor or
12 its optimization opportunities as related to
13 different species, recognizing that only a portion
14 of the life stage other than Delta smelt occurs
15 in -- occurs in the Delta.

16 So as we looked at -- at federal and
17 state -- potential federal listed species and
18 potential State listed species, there had to be a
19 combination and have a demarcation between what
20 activities are you doing in the upper watersheds or
21 in the main stems or the tribs to the main stems
22 that are critical as natal streams for rearing. And
23 then that component had to almost stand alone in
24 part with the exception of as it relates to the
25 alternatives, the three alternatives that make

1 structural changes in the Delta.

2 But, obviously, how well they do in the --
3 in the tribs, the actions are being taken care of in
4 the main stem of the tribs, the natal areas, then it
5 became an issue of what -- what that contributes
6 plus what the Delta changes contribute to the
7 recovery of the species.

8 So that was kind of the approach that was
9 teased together as kind of incremental.

10 If we were to just -- as Pete properly
11 characterize, just rely on Delta improvements, with
12 the exception of Delta smelt issues, we could not
13 expect to make the recovery (inaudible). But there
14 needed to be a clean -- a clean demarcation.

15 I think the last point is that the issue of
16 uncertainty leads you to the issue of "Well, how do
17 we then make the decision?" And I think we're going
18 to have a series of relative ranges and a series of
19 hypotheses and, you know, Dick Daniels discussed
20 yesterday the indicators and a variety of ways we're
21 going to manage to integrate the CMARP and IAP
22 activities. And essentially, at some point, you
23 know, this group is going to have to say, "We
24 believe that we want to test this hypothesis that
25 we're comfortable that this arrangement deserves

1 an opportunity for implementation and yes, there's a
2 significant investment in that."

3 And then you're going to have to use your
4 adaptive management theory and application to see if
5 in fact the first seven years or the full 30 years
6 of this project established the benefits on all the
7 fronts of this mission, you know, that -- that we --
8 that we want to attain.

9 So I guess what I'm saying, this is not --
10 you're not going to get, from my perspective -- and
11 Ron and Pete, tell me if I'm wrong immediately -- an
12 issue where you're going to get a series of gauges
13 as it relates to the benefits to species that are
14 absolutes. There are so many dynamics involved
15 there that you've all been exposed to now, that
16 you're going to get a probability. And from that
17 probability you're going to have to make a decision
18 that it's an investment worth making.

19 CHAIRMAN McPEAK: Okay.

20 MR. CHADWICK: And this has been pointed
21 out over the first seven years or so, some number of
22 years we're going to be living with the existing
23 system and incorporating changes. The physical
24 changes, no matter what you want, just can't occur
25 instantaneously.

1 CHAIRMAN McPEAK: Thank you very much
2 for your presentations, Ron and Pete, and Ryan, your
3 comments. I think we realize that this, too, is a
4 very complex and critical, vital issue to the whole
5 work of CalFed and BDAC and we apologize for the
6 limited time, but this is a very good start into, I
7 think, a new level of substance and detail.

8 You will have observed that we now have our
9 Chairman, and I am delighted. So I'm prepared to
10 turn this over to him. Just let you know that Mike
11 yesterday was very engaged in opening up a new
12 housing project subdivision that ultimately will be
13 4,000 units, but the first phase it went very
14 successful. So providing homes, affordable homes
15 for people in California, is a very laudable
16 endeavor and we understand what you were doing.

17 MR. HILDEBRAND: Was it on prime ag
18 land?

19 (Laughter.)

20 CHAIRMAN McPEAK: It was not on prime ag
21 land. There is water for it. I'm sure there is
22 efficient water conservation, outdoor irrigation of
23 water, there better be. All those things I'm sure
24 it's a model for.

25 Mr. Madigan.

1 CHAIRMAN MADIGAN: Let's see, do I have
2 to defend myself here?

3 I delayed this project a year to
4 renegotiate the boundaries with the city, the
5 county, the state and the feds over the multiple
6 habitat plan that they wished to implement, and we
7 did that. Yes, we are currently in negotiations for
8 a reclaimed water line that will run right through
9 the project.

10 We sold the least expensive houses in the
11 City of San Diego to a group that looks like the
12 United Nations of young, enthusiastic, excited
13 people buying their first home. It was -- it was
14 neat to see and neat to be a part of, and I'm glad
15 to be here today because yesterday was actually fun.

16 (Laughter).

17 CHAIRMAN MADIGAN: And that doesn't
18 happen too often.

19 MS. McPEAK: That makes one of you.

20 CHAIRMAN MADIGAN: That's right. Yeah,
21 it sounds like you guys had a real good time.

22 Where are we?

23 MS. McPEAK: We're here on a -- we -- I
24 don't think we have Mr. Cahill here yet.

25 Is that true or is it out --

1 CHAIRMAN MADIGAN: I haven't seen him.

2 MS. McPEAK: Okay. Then we'll proceed
3 with our panel, and Ann actually is going to be our
4 moderator and I think handle it all.

5 CHAIRMAN MADIGAN: Thank you, Ann, lead
6 us on.

7 MS. NOTTOFF: I'm going to have the
8 first set of speakers join us at the table here.
9 They're going to -- the first set is going to talk
10 about fisheries and communities and economic impacts
11 here in the Bay.

12 I -- we've asked -- we've pulled together a
13 set of speakers today to give the members of BDAC
14 who are from all over the state, a clear
15 understanding of the economic interests here in the
16 Bay and coastal areas that depend on a healthy
17 Bay-Delta ecosystem and freshwater flows as well as
18 a primer on why in fact what happens on Butte Creek
19 or in San Joaquin County really does make a big
20 difference here in the San Francisco Bay.

21 In pulling together this panel today I do
22 want to thank members of the Environmental Water
23 Caucus and others who have worked on this and
24 identified I think some people that I think you'll
25 really find informative this morning.

1 You'll note that I am not Tom Graff as some
2 of the agenda items say that Tom was going to do
3 this. He graciously volunteered to cover this if
4 I -- I've been out of the loop for the last couple
5 of weeks with a family emergency, but yesterday
6 afternoon's BDAC session was so energizing I
7 thought, Okay, I can stand up there today and
8 introduce this panel. So it wasn't that bad, Mike.

9 We've also -- the first panel you're going
10 to see today is -- they're going to talk about
11 fisheries and economic interests here in the Bay.
12 And I think since we're running behind time, we'll
13 ask people to be as succinct as possible. I think
14 people will be talking from three to five minutes
15 and Roberta is going to be our timekeeper.

16 We had originally thought that we might
17 take questions in between the panels. Let's see how
18 we're doing on time and see if that makes sense.

19 CHAIRMAN MADIGAN: All right.

20 MS. NOTTOFF: If it's a problem, then we
21 can just keep questions until the end.

22 CHAIRMAN MADIGAN: Okay.

23 MS. NOTTOFF: So why don't I just
24 introduce -- if the people will self-introduce
25 themselves and here we go.

1 Thanks.

2 CHAIRMAN MADIGAN: Thank you very much,
3 Ann.

4 Good morning. Welcome.

5 MS. HOLLAND: Thank you. I don't know,
6 this is on?

7 CHAIRMAN MADIGAN: This is on.

8 MS. HOLLAND: Good morning. My name is
9 Elise Holland, I'm a biologist with the Bay
10 Institute and as Annie said, I will keep my comments
11 very brief.

12 I want to -- I want to cover three specific
13 topics today and I'll do them as quickly as I can.

14 The first is I want to discuss this issue
15 of uncertainty with you.

16 The second is I want to give sort of my
17 view of the diversion effects team effort as a
18 member of that group.

19 And the third is I want to talk a little
20 bit about baseline issues and where CalFed I think
21 should be going from here from a modeling and
22 opportunities perspective.

23 CHAIRMAN MADIGAN: We are not so short
24 on time that you should not tell us those things we
25 need to know.

1 MS. HOLLAND: Okay. Thank you.

2 Okay. This issue of uncertainty, I want to
3 bring this up because I think it's something that we
4 all need to, if possible, increase our level of
5 comfort with. And by that I mean, one of the
6 primary principles or tools that CalFed is going to
7 attempt to use as it goes through the short and
8 long-term solution process, is this concept or this
9 tool of adaptive management, and Ryan raised this
10 and I'm glad that he did.

11 Inherent in adaptive management is this
12 issue of uncertainty. And by that I mean adaptive
13 management allows us to decide to take an action
14 based on a hypothesis that we've crafted and -- with
15 the understanding that we may or may not get the
16 result that we expect to get, and then constantly
17 reassessing our objectives or our hypotheses and our
18 actions to refine or improve those actions so we can
19 get to the ultimate goal.

20 And I think this is important to raise
21 because I -- I have a feeling that some members of
22 the CalFed policy group or other members of this
23 process are looking for an answer and I -- one
24 answer on how we're going to solve the problems in
25 the Delta, and there is no one answer. And I just

1 want to say that for the record. There are a lot of
2 answers and there are going to be a lot more
3 questions than we have today as we go through this
4 solution -- this implementation of the solution
5 process.

6 So I just -- I just want to put that out
7 there. And that also relates to the second topic I
8 want to cover, and that is the diversion effects
9 team effort. I -- I think you got a lot of
10 information this morning and it probably was a lot
11 to digest, but I hope that you read the report or at
12 least the summary of the report and look at the
13 matrices if you haven't already. I'm sure a lot of
14 you have.

15 Inherent in those matrices are also a lot
16 of uncertainty and a lot of assumptions. We made a
17 lot of assumptions going in because of a couple of
18 things.

19 One -- oh-oh.

20 CHAIRMAN MADIGAN: Don't take this
21 personally.

22 Okay, guys in the back, those are the light
23 switches. All right.

24 MS. NOTTOFF: One issue is the fact that
25 we were given very limited time to do this analysis

1 and so we had to do the best we could with the data
2 in hand, and we didn't really have an opportunity to
3 go out and collect new data or crunch new numbers.
4 And so we had to use professional judgment, and --
5 and Pete pointed that out.

6 But again, I want to highlight that here.
7 So -- so take that into consideration when you read
8 the report. I think that -- that what you'll see
9 there is that there are a lot of pluses and minuses
10 or trade-offs that occur when you start looking at
11 the different alternatives of -- in terms of how
12 they may benefit or impact the species of concern.

13 And I want to just highlight for you some
14 of the things -- some of the gaps that -- that Pete
15 identified, but again I want to highlight so you can
16 consider as you read the report.

17 The first is this issue of species breadth.
18 We focused on three groups of species, salmon,
19 striped bass and Delta smelt, representative of
20 different life-history strategies. Salmon as a
21 species that moves through the Delta on its upstream
22 and downstream migration paths and so has limited
23 exposure to Delta conditions compared to the other
24 two groups of species; striped bass which spend most
25 of their life cycle in the estuary, and Delta smelt

1 who unfortunately live in the estuary and so they
2 get the hardest hit.

3 So there are a lot of other species out
4 there that we care about, (inaudible) species and
5 other anadromous species, and those are not -- those
6 were not dealt with specifically. We just assumed
7 that we were covering their life-history strategies.
8 So we might want to -- we might want to consider
9 looking at those in more detail, like steelhead and
10 split-tail.

11 Second is this concept of modeling. We
12 used one modeling run to do this analysis. And that
13 was CalFed's base case modeling run which includes
14 existing biological opinions but not necessarily
15 everything in a recovery plan because you can't
16 really model that, but existing biological opinions
17 for winter run and Delta smelt. But also only the
18 upstream actions that were part of the CVPIA B2
19 decision that came down last November and not the
20 in-Delta actions which are now part of policy.

21 And thirdly, the base case reflects a 2020
22 level of demand and not 1995 level of demand. So
23 whether or not that matters in our analysis I'm not
24 entirely sure, but I think we need to construct a
25 new base case to get a more realistic picture of

1 what we -- what the system looks like today and what
2 we can do to improve conditions today.

3 I already touched on the time line. Again,
4 it was a very short time line. I want you to know I
5 think the report is credible but understand that we
6 were under duress.

7 For the common programs and the effects of
8 the common programs, we focused on two specific
9 aspects of the common programs:

10 One is in-Delta screening of those ag
11 diversions of which there are many, some 1800 I
12 believe, that still need to be screened. And the
13 second was the creation or restoration of
14 shallow-water habitats.

15 And we tried to get our heads around how we
16 thought those benefits or impacts might play out.
17 And with screens it's a little bit easier but we
18 still don't know how to screen striped bass, eggs
19 and larvae or Delta smelt young. But with the
20 shallow-water habitat issue it's a little bit more
21 difficult because it depends on where the habitat
22 is, how much of it and what type is built.

23 In other words, if you build it in a salmon
24 migration corridor in the western part of the Delta,
25 yes, that would probably provide a benefit to

1 juvenile salmon. So you see where I'm going. We
2 need a little bit more detail on the common
3 programs.

4 The water quality issue came up numerous
5 times. We didn't necessarily have expertise in the
6 group to discuss kind of the synergistic or chronic
7 effects of water quality and we -- we don't have a
8 lot of those answers.

9 As Alex mentioned the exotics issue and our
10 uncertainty there, the same applies to water
11 quality. And the exotics issue was also dealt with
12 kind of peripherally. There are so many species out
13 there that we have yet to identify. We have very
14 little understanding of how they're affecting
15 endemic species and what their relationships are
16 between use of habitat and other food chain
17 interactions. We need to do a lot of work there as
18 well.

19 Flows below Hood was an issue that Pete
20 discussed and -- and there was some uncertainty
21 there in terms of whether or not you would decrease
22 flows enough to the point where you would lose
23 benefits downstream by creating new shallow-water
24 habitats to benefit salmon. So there are some
25 trade-offs there.

1 And then there is also this issue of kind
2 of sloshing back and forth of a salmon juvenile that
3 might bypass the screen on the Sacramento River but
4 because of tidal effects be pushed back north and be
5 exposed to the screen multiple times. So there are
6 uncertainties there as far as mortality or other
7 injurious effects that might occur.

8 And then finally, this issue of recovery.
9 We -- we didn't define recovery in the group. We
10 felt unanimously that that was a policy decision
11 and also that we were asked to look solely at the
12 legal Delta. And it was our feeling that if you
13 really wanted to achieve recovery of all these
14 species, which I believe is the goal of CalFed, you
15 had to look at the entire system, both upstream and
16 downstream. And that's part of what we're going to
17 do now.

18 But you also had to understand that we
19 weren't going to get there in Phase 1. And that's
20 sort of what we were looking at in the beginning of
21 this process was, you know, what's the best choice
22 now for Phase 1.

23 And I want -- I want to close by touching
24 on this -- on this issue of where we are today
25 versus where we think we want to go. And it gets

1 back to modeling which I pointed out in the
2 beginning. The modeling that CalFed is currently
3 using uses -- utilizes some assumptions that the
4 environmental community, and I do not necessarily
5 agree with, that relate to demand.

6 And so what I -- hopefully, what I think
7 this group should do and will do in our -- in our
8 next phase of work is meet the biggest challenge
9 that CalFed has right now. And that is, figure out
10 some way in this first phase of five, seven to ten
11 years how not to continue to lose populations of
12 striped bass and salmon and Delta smelt, how to get
13 beyond the status quo of those abundance levels, how
14 to maintain water quality, at least not let it
15 continue to deteriorate but actually improve water
16 quality, and how to continue to meet demand.

17 We've got to do all those things in the
18 first phase before we figure out what some long-term
19 solution is. And in order to do those things, we
20 have to ask a lot of questions of ourselves using
21 adaptive management, but we also have to have a
22 better understanding of how we can optimize the
23 existing system from an operational perspective.
24 And that is what this group is going to attempt to
25 do primarily.

1 How do you build a better Delta from a
2 fisheries perspective while continuing to deal with
3 those other two prongs, water quality and water
4 demand. And that's going to take a reality check, I
5 think, from a modeling sense. We need to get a
6 better -- we need to have a much more clear
7 perspective of where we are today before we try to
8 decide where we want to go.

9 Thank you.

10 CHAIRMAN MADIGAN: Thank you.

11 Yeah, if there are a couple of questions
12 now, Ann, we'll certainly take them.

13 Eric and then Pietro.

14 MR. HASSELTINE: You were kind enough to
15 give us a written analysis here, one page that we
16 have.

17 MS. HOLLAND: Uh-huh.

18 MR. HASSELTINE: And I think you just
19 touched on it, what my question was, which is
20 related to the last paragraph. But -- and I'd like
21 you to clarify that a little bit if you can. I --

22 MS. HOLLAND: Okay.

23 MR. HASSELTINE: I mean, basically, what
24 you're saying here is that CalFed has it backwards,
25 which is possibly true, but I'd like to understand

1 that.

2 In other words, you're suggesting that
3 whatever approach we're on is not the right one to
4 really look at this issue, and I think it's a -- it
5 obviously is an issue of very great importance and
6 potential high impact on everything we're doing
7 here.

8 MS. HOLLAND: Uh-huh.

9 MR. HASSELTINE: So we want to get it
10 right. So could you just clarify for me why you
11 think the way that we're currently looking at this
12 is not right?

13 MS. HOLLAND: What I -- there is the one
14 page of this outside in the hallway if anyone wants
15 a copy.

16 And I do say in here that CalFed currently
17 has it backwards. And what I -- sorry, Lester --
18 and what I mean by that is we need to -- we need to
19 be doing our initial work by reflecting today's
20 reality. And that means building a base case that
21 reflects 1995 level demand and all existing policies
22 from AFRP B2 actions, to biological opinions, to
23 water quality control plan standards, including
24 VAMP, et cetera, et cetera. All those things that
25 are current tools should be in the base case.

1 And then we should be able to say, "Okay,
2 given these tools and given what we know existing
3 demand is, how do we continue to meet that demand
4 while making the system more fish friendly?"

5 I believe there are ways to do that,
6 whether it's using different EI ratios, whether it's
7 shifting, timing or magnitude of pumping from one
8 time of year to another, in addition to using other
9 tools, like additional groundwater storage,
10 transfers, conservation and efficiency measures.

11 Let's try to maximize our efforts there and
12 then start saying, "Okay. Five years down the road
13 from now, after we get some preliminary answers to
14 our questions about doing these new optimization
15 approaches, where are we, and where is the demand
16 level, and what is the more realistic expectation of
17 where we really need to be in 10, 20, 30, 40 years
18 from now?"

19 So let's -- let's check the truth now and
20 then that will help us, I think, be more effective
21 later on.

22 That's what I meant by that.

23 MR. HASSELTINE: Thank you.

24 CHAIRMAN MADIGAN: Pietro, then Byron.

25 MR. PARRAVANO: Thank you, Michael.

1 Elise, thank you for the report and also
2 thank you for offering to serve on the fish team.

3 I -- there's one comment that I have when
4 you mentioned that on the team there is differing --
5 differing views of the modeling about exactly what
6 points of the -- to really be putting into the
7 model. And you said that you wanted -- the
8 short-term objective is to look at trying to keep
9 the Delta Bay and Delta status quo for at least the
10 next six, seven years without -- without further
11 destroying the habi -- or the water flows and the
12 habitat, and then meanwhile to look at the -- at the
13 longer term picture.

14 And you mentioned that two -- there are two
15 prongs, you want to do that while also considering
16 two other issues, the water quality and water
17 demand.

18 Now, in terms of the water demand --

19 MS. HOLLAND: Uh-huh.

20 MR. PARRAVANO: -- can you -- can you
21 explain that, which -- demand from which
22 perspective?

23 MS. HOLLAND: I meant that from the --
24 from the agricultural community.

25 MR. PARRAVANO: Okay. I --

1 MS. HOLLAND: I think we have to be
2 realistic in that we're going to continue to deliver
3 water to the urban sector and to the agricultural
4 sector regardless. But there are smarter ways to do
5 that and there are other tools that can be utilized
6 by those communities to meet their demand currently
7 and any existing demand that may bear out.

8 MR. PARRAVANO: There's something that
9 I -- I would encourage the fish team to be looking
10 at --

11 MS. HOLLAND: Okay.

12 MR. PARRAVANO: -- both in terms of the
13 short-term and the long-term strategy for resolving
14 the water demand is that you have to include water
15 demand for the fisheries.

16 MS. HOLLAND: Uh-huh.

17 MR. PARRAVANO: If the fisheries are
18 going to be feeding people with this -- the society
19 that's going to have an increased population in the
20 next 20 to 30 years, there has to be an increased
21 water supply for the fisheries.

22 MS. HOLLAND: I agree.

23 MR. PARRAVANO: And something -- a point
24 I made yesterday in terms of just showing the equity
25 of fisheries and agriculture and urban water

1 districts, that if the population is going to
2 increase and is going to put that much more demand
3 on the water supply, the fisheries cannot suffer
4 because of that.

5 So that's -- I would encourage -- I was --

6 MS. HOLLAND: I agree with you --

7 MR. PARRAVANO: Yeah.

8 MS. HOLLAND: -- and that's what I
9 meant. I mean, Mike Spear (phonetic) put it pretty
10 emphatically in the policy group the other day when
11 he said, "We need to get to purple, we need to get
12 the sixes and the sevens" -- referring to the Barney
13 joke -- "sooner rather than later, and you're not
14 going to get to purple if you continue to go towards
15 yellow."

16 So what I'm saying is incremental benefits
17 have to occur every step of the way. And we need to
18 figure out how to restore some equity to the system,
19 yes, but we need to be more creative about how --
20 how we're doing that because we're not -- we're not
21 fully utilizing our creative talents right now.

22 So I agree with you, Pietro.

23 CHAIRMAN MADIGAN: Okay, thank you.
24 Byron, and then we're going to get on with it.

25 MR. BUCK: Thanks, Mike.

1 Elise, I appreciate your remarks,
2 particularly on the uncertainty issue and the
3 adaptive management issue, I couldn't agree with you
4 more. There's lots of questions and lots of answers
5 and we don't necessarily have them all integrated.

6 Also, I think it would be useful to do a
7 run with the existing baseline to know where we are
8 today and what we might -- how the different
9 configurations would change the today condition.
10 But that's not necessary with the no-action
11 condition because demands will continue to increase
12 and grow and we've got a system out there that
13 essentially will try to meet those demands within
14 the limitations of physical infrastructure and water
15 rights.

16 So --

17 MS. HOLLAND: Right.

18 MR. BUCK: -- we can't be thinking that
19 just because we had -- have 1995 demands, that
20 existing policy will keep those where they are.
21 They will change based upon the nature of the growth
22 --

23 MS. HOLLAND: Uh-huh.

24 MR. BUCK: -- in demands and the system
25 will do its best to accommodate them within the

1 limits of current standards and current physical
2 facilities.

3 So that truly a no-action alternative, we
4 will see increased demands on the system at certain
5 times, and so we need both analyses to look at where
6 we're going if we do nothing and what could we do
7 today if we could hold it static.

8 MS. HOLLAND: I agree with you, Byron,
9 but I want to make sure we have that other bookend.

10 MR. BUCK: Yeah.

11 CHAIRMAN MADIGAN: Okay. Thank you.

12 Ann?

13 Good morning.

14 MR. BOITLER: Good morning. Is this
15 mike on?

16 CHAIRMAN MADIGAN: You are.

17 MR. BOITLER: My name is John Boitler
18 (phonetic) and I am here today representing the
19 Fishery Foundation of California to talk to you
20 about the economics of recreational angling or as
21 it's commonly called sportfishing.

22 No one knows exactly what economic
23 contribution recreational angling makes to the
24 state's economy today because such estimates are not
25 made on an annual basis of this economic activity.

1 Generally speaking, the best source of
2 information that we have regarding the contribution
3 is an estimate provided once every five years by the
4 U.S. Fish and Wildlife Service. The report they
5 publish is called "The National Survey of Fishing,
6 Hunting and Wildlife Associated Recreation."

7 Their 1996 report estimated that the
8 37 million angler days adults spent sportfishing
9 generated some \$3.7 billion in direct expenditures
10 and a total economic contribution of \$7 billion to
11 the state's economy. California ranked No. 1 of all
12 the states in the nation in money generated and in
13 the number of days anglers fished.

14 As impressive as these numbers may sound,
15 this activity was made by a depressed sportfishing
16 industry which has suffered from the effects of
17 declining fisheries, especially in Northern
18 California where many of the prized fish have been
19 listed under state and federal Endangered Species
20 Acts.

21 Angling success directly affects the amount
22 of future fishing effort and the dollars expended in
23 the marketplace. Nowhere is this more evident than
24 in our own backyard. Declines in the estuary's main
25 fisheries, striped bass, salmon, steelhead, American

1 shad and sturgeon, have resulted in several billion
2 dollars of economic activity not being generated
3 over the past 30 years.

4 The most comprehensive economic report on
5 this subject was done for the California Department
6 of Fish and Game in a report they entitled
7 "Anadromous Fisheries Report 85-03," which they
8 published and released about a decade ago.

9 The report found that due to the extensive
10 and prolonged declines of the estuary's fisheries,
11 recreational angling activity had also dramatically
12 declined along with commercial fishing benefits to
13 the economic sector. As these declines began to
14 affect fishing success, angling effort also
15 declined, slowly at first, but over the decades this
16 resulted in hundreds of millions of dollars on an
17 annual basis not being generated.

18 And that effect was that many anglers
19 stopped spending money on trying to catch fish that
20 weren't there. Something like going to Safeway and
21 not finding milk and saying, "Guess I'm not going to
22 spend money on milk." As a result, some of the
23 sportfishing businesses that depend upon anglers
24 fishing for those species also declined.

25 The striped bass fishery may well provide

1 us the best example of how demand for a fishery can
2 decline as fishing success rates fall. Thirty years
3 ago this fishery was called the premier fishery of
4 the estuary. Today it has declined nearly 80
5 percent and, as you may well know, its population is
6 not self-sustaining.

7 Instead of nearly three-quarters of a
8 million anglers that fished for striped bass 30
9 years ago, we find some 300,000 anglers
10 participating today. To varying degrees, the
11 result has been similar for steelheads, shad,
12 sturgeon and salmon fishing.

13 Another analogy which I hope you'll find
14 informative can be found in the data on the number
15 of angling days spent fishing annually. In 1989,
16 anglers spent 58 million angler days fishing in the
17 state. In 1996, that number was reduced to 37
18 million angler days, representing a decline of 21
19 million user days. This kind of participation
20 decline has had a significant and unmitigated
21 economic impact on the sportfishing industry.

22 Since for the most part anglers do not fish
23 for economic motives, these fishery declines must
24 also be discussed in other terms. Most of those
25 that I know that fish, do so because they greatly

1 enjoy fishing and the catching process. When they
2 cannot catch fish, it's rather like trying to go --
3 it's like trying to go swimming without water, a
4 less than satisfying experience.

5 They love the sport as well as the resource
6 and the environment that makes it possible. Whether
7 on the ocean, the Bay, the Delta or on a river,
8 these folks -- for these folks fishing helps to make
9 living and working worthwhile. Simply put, fishery
10 declines represent a loss in their quality of life.
11 They cannot simply change their preferences and find
12 another sport. This love of fishing is something in
13 their very nature.

14 Since we all -- well, since as a form of
15 science and government we have the knowledge and
16 technology to manage our fisheries on a sustainable
17 basis, this would encourage recreational activity
18 and of course be good for our economic well-being.
19 It's truly unfortunate that these renewable public
20 resources have been allowed to decline.

21 In addition to the issues it raises about
22 the quality of life, these declines represent at
23 best an inequitable public policy that prevents
24 citizens from exercising the right to fish in the
25 waters of the state as guaranteed by the state's

1 constitution. It erodes the faith that anglers have
2 in allowing the state and government to be the
3 trustee of public resources while substantially
4 impacting the state's economy.

5 That basically concludes what I have to say
6 to you about the economic losses and the impacts on
7 recreational angling. I wish there was more data
8 readily available but I think I would like to take
9 questions if you have any and answer them.

10 CHAIRMAN MADIGAN: Thank you, sir. We're
11 going to go ahead and hold the questions. I
12 probably should be a little more mindful of the time
13 here, but we will have time for questions at the end
14 as well as public comment.

15 Good morning.

16 MS. BECKETT: Good morning, my name is
17 Peggy Beckett. My husband and I have a charter boat
18 fishing operation in Half Moon Bay, and for those of
19 you from other parts of the state, Half Moon Bay
20 lies about 30 miles south the coast from
21 San Francisco.

22 By way of introduction of myself to you,
23 I've been in the sportfishing and have done some
24 limited commercial fishing since 1974. My husband
25 who's my partner in my life and in my business, has

1 been fishing all his life since he's been 17 years
2 old in just about everything you can catch off the
3 California coast just about everyplace.

4 So we -- we come with some experience,
5 some -- you know, one of us more than others. I
6 participate locally in watershed restoration work on
7 a countywide basis on a Fish and Wildlife Advisory
8 Committee. At a state level, I've just recently
9 joined the Salmon Advisory Committee as a
10 sportfishing representative alternate. And
11 federally, I hold an appointment at an at-large
12 fishery seat on the Habitat Steering Group for the
13 Pacific Fisheries Management Council.

14 But the reason I'm here today mostly is to
15 talk about how the water and the things in the Bay
16 affect what happens with my business.

17 I can't stress enough, and all of you from
18 what I've heard this morning know as well as
19 everyone else, all of us that use it in different
20 ways, how important the clean water and the adequate
21 water flows and reliable water flows are to all of
22 us in the Bay and in the Delta.

23 The Bay's nursery area, it's the nursery
24 area for the anchovies and the herring, those are
25 the forage fish that our salmon and our striped bass

1 and our halibut and our rock fish all eat. These
2 forage fish are our link in the food chain, which
3 the game fish that my clients catch depend on.
4 These fish need the wetlands as well for their
5 nursery areas.

6 The people who come to fish on our boats,
7 they come from all over. We carry a lot of local
8 clientele but we carry people that come from all
9 over the world. They come to have an experience,
10 maybe it'll be the only time they ever get to go and
11 do that. We -- we try to function as an educational
12 place as well as providing recreation for them. And
13 they stay in our restaurants -- they stay in our
14 hotels, they eat in our restaurants, they buy
15 souvenirs. They provide a lot of local economy.

16 In the business that I have, which is a --
17 is a landing business, I book and represent seven
18 charter boats. They go from 28 feet in length to 65
19 feet in length and they carry anywhere from 6 to 48
20 people. We probably carry between 15 and 20,000
21 people a year, and I'm one of two major landing
22 operations in my harbor.

23 What happens with the water has a real
24 direct impact on everything that happens with all of
25 our livelihoods. And as a member of Golden Gate

1 Fishermen's Association, I realize how many more
2 boats it impacts. They represent boats that go
3 from Fort Bragg to Monterey Bay and we all catch the
4 same species of fish and all the -- I've lost my
5 train of thought here.

6 I would encourage you folks to adopt an
7 alternative that will provide adequate and reliable
8 and clean water through the Bay and Delta that's
9 going to ensure the complete life cycle of the fish
10 that depend on the water.

11 I know that my business needs it. We need
12 it to help prevent the devastation of our coastal
13 economies. We need to know how much water we need
14 for these fish. What -- what do we need to sustain
15 these fish populations. And it is a renewable
16 resource but it will depend on all the decisions
17 that all of you make to make it happen.

18 One other piece that I want to add that I
19 heard Pietro mention earlier is about increase in
20 people and increase in the need for fish. We hear
21 about the increased needs of all the other users in
22 the state for water because populations are going to
23 increase.

24 Well, the populations of the people that
25 want to use the resource will increase, too. And

1 the populations of the people that are going to want
2 to eat the fish that the commercial fishermen are
3 going to increase, too.

4 And so -- so it goes further than just what
5 I might need for my business to make it happen for
6 me but for all the people of the state.

7 Thank you.

8 MS. NOTTOFF: Yes, let's go on.

9 Mr. Carpenter.

10 MR. CARPENTER: Earl Carpenter.

11 MS. NOTTOFF: Yes.

12 MR. CARPENTER: Yes. Ann, I thank you
13 for a chance to get acquainted today.

14 I am a commercial fisherman, have been all
15 my life and my dad was too. In fact, he was an old
16 gill netter, gill netted in the rivers before they
17 were closed. And he was a unique person. He was --
18 always told us kids when we went fishing that, "Hey,
19 it isn't out there. It's in the river," that's
20 where the action was. We didn't pay much attention.

21 But to make a long story short, and I'm not
22 going to get long-winded about it, I have thoroughly
23 being a fisherman all my life and I intend -- I
24 allowed my boys to take that time, too. But, you
25 know, what I'm doing now is working long enough to

1 get my grandkids through college because there
2 really isn't too much future.

3 And it isn't because California hasn't done
4 a fair job on the salmon. Considering what you --
5 what the dangers are, they have done I think well.
6 And I'm judging that because I happen to have spent,
7 I don't know how many years it was, five, six, seven
8 years as chairman of the State Salmon Advisory
9 Board. And I stepped down from that when we printed
10 the restoring the ballots. That was our final
11 thing, and it had -- I hoped that we had conveyed
12 the idea with that of what is possible in getting --
13 saving our agricultural industry and the fishing
14 industry, too.

15 More and more in my lifetime as we met with
16 the farmers, we had very good luck in talking pretty
17 good sense to them. They're -- they're the same
18 type of people we are. Nat Bingham was doing great
19 work up with the different people. I'm just sick
20 about losing him because he was our point man we
21 shoved out there to talk to them.

22 And -- for instance, it's like with Salmon
23 Committee which I also hold a seat on, we used to go
24 down and meet in Merced at this little tiny hatchery
25 that the Merced Irrigation District had. And we

1 laughed when they seen these -- there were two
2 ladies and a man, they were operating this little
3 thing, and quite frankly, they'd get those big old
4 salmon and they'd just club the heck out of them,
5 you know.

6 So the first thing we bought them was a
7 hydraulic lift that looked like something that was
8 on the back of our boat to pick our crab tanks out
9 for them people to get their fish up in and take the
10 eggs out of them and hatch them.

11 In later years, we also bought them some
12 hatch boxes they used in the hatchery and they
13 put -- they put some bigger pins in.

14 And the irrigation district has done a fair
15 job there. And I'd like to say that because, you
16 know, there's -- there's -- you're going to have to
17 have a program come up that everybody's going to
18 have to live with. And there are people in the
19 agricultural industry that more and more are aware
20 of what the problems are and, sure, they want their
21 water and stuff.

22 But there's places in California where
23 those old irrigation dams are so old, the best thing
24 you can do is build a new one and blow them out of
25 there because they're just a waste of water.

1 They're just -- when they use them and then they run
2 off and they're running the rest of the year out
3 there and nothing, there's no -- don't need them.
4 With better systems, well, they'd probably use less
5 water.

6 And the main thing, we got to have the
7 water reach the river for our salmon to come that
8 step. And that's what -- up in Butte Creek what
9 we've worked out with the irrigation people.
10 There's a place, by the way, that still has spring
11 run fish, those huge, big fish that we've eliminated
12 in the San Joaquin system.

13 Of course, they will never be because
14 genetically you can't replace them. They were the
15 big fish that would have to jump over a force falls
16 and then they stayed up the river for a long time
17 because the water is too cold and it takes them
18 longer to hatch. And so they're actually getting
19 them down, almost got a five-year-old fish, that's
20 why they're so big.

21 But we still have those in -- in the
22 northern part. That's where Nat Bingham was working
23 and, God bless him, and maybe he's made -- he's made
24 progress on it.

25 And that's about all I have to say. I do

1 appreciate what you people are doing and I'm not --
2 I'm a little fearful of how it's going to come out
3 because it seems like we have had so many losses up
4 and down the coast. But all in all, California even
5 with all the shutdowns we have now and going through
6 an El Nino now, has -- there's a lot of rivers that
7 have shown a pretty good sign that we're doing the
8 right thing.

9 And that's all I have to say.

10 CHAIRMAN MADIGAN: Thank you, sir. You
11 remind us that this isn't all just old dry old
12 science. Thank you.

13 Good morning.

14 MR. GREGG: Thank you, Mr. Chairman.

15 My name is Zeke Grader (phonetic), I'm
16 Executive Director for Pacific Coast Federation of
17 Fishermen's Association and on your agenda I'm
18 filling in Pietro's slot. I was not supposed to
19 have been here because of jury duty, but I'm happy
20 to say a verdict was rendered and justice was
21 served.

22 (Laughter.)

23 MR. GRADER: So I'm here.

24 There are just five short points that I
25 want to make in all of this.

1 First of all, one of the outstanding
2 concerns we have, particularly after listening to
3 the report earlier this morning by Pete Chadwick, is
4 the fact that we have this DEF team now put
5 together, this Delta -- whatever it stands for --
6 team. And the thing that concerns me is that while
7 it did mention that stakeholders are involved, I
8 should say that there is one stakeholder that is
9 notoriously absent on that. And that is the fact
10 that there is nobody on this team from either the
11 commercial or recreational fisheries. And that's a
12 pretty egregious situation.

13 We have the diverters are represented but
14 nobody there to represent the interests of the fish
15 or those who depend upon them. And I would hope
16 that that, No. 1, would be corrected fairly soon.
17 And it's not that we did not submit names of
18 qualified biologists to be on the team. It's just
19 simply that those recommendations were never acted
20 upon.

21 Second, as far as the economic impacts,
22 you've heard from some of the people here today and
23 obviously you heard from people in Fresno ad nauseam
24 about the impacts -- potential impacts that people
25 think may happen to them as a result of what's

1 happened -- what may -- the impacts might be from
2 any of these alternatives.

3 Most of those are talking speculatively.
4 I'd like to have you -- invite you to take a look at
5 where the economic impacts have already been felt,
6 and have been felt now over the course of 20 years,
7 even 40 years.

8 One is you can go up -- just go up to
9 places like Fort Bragg which was up till 15 years
10 ago the No. 1 salmon port on the Pacific coast,
11 California, Oregon and Washington. It's now a
12 virtual ghost town.

13 Go to Eureka and look at that place in the
14 summer. It used to be a bustle with fishing boats.
15 It's nearly a ghost town. The salmon fleet is gone.
16 Take a look at what's happened to the seasons, the
17 six-month seasons. They're no longer there.
18 They're little pockets of time.

19 The economic impacts in the fishing
20 industry are not speculatively. They're already
21 there, and they've been severe and horrendous. So
22 I'd hope that that be considered in all -- all of
23 this.

24 The actions, there have been people talking
25 and you heard Mr. Chadwick talk about, "Well, we

1 have to look more at -- at ocean management." I
2 would submit that we've been managing the ocean
3 fisheries for 40 years or more.

4 When the San Joaquin River, after Fryant
5 Dam (phonetic) was put in and the spring-run salmon
6 that were lost, made extinct by the operation of
7 Fryant Dam, no changes were made in dam operations
8 but the fishery was outlawed in the Bay and Delta,
9 an historic fishing that existed for a hundred
10 years.

11 Now what we're looking at, we've seen the
12 Federal Government managing the fishery basically
13 since 1977. There's been a lot done to restrict
14 fishery. Every year more and more restrictions go
15 in, but almost nothing has been done to correct the
16 problems inland.

17 Now, some of these obviously are not
18 water-related, some of them quite clearly are
19 timber-related when we were talking about Koho
20 salmon on the north coast, Oregon and Washington.
21 But nevertheless, none of the actions in the river,
22 very little has been done there.

23 Now, people talk about, "Well, we've got to
24 get some more controls over the fishery." Let me
25 just point out that last year the spawning

1 escapement goal, that is, the goal we have to
2 maintain optimum populations of salmon in
3 California, were not met, they were tripled. That
4 is, we had three times more fish back up the river
5 than was needed for optimum spawning escapement.
6 Not minimum, optimum. That's not a problem with
7 fishing effort out in the ocean.

8 So when people talk to you, "Well, we've
9 got to get handles over the fishing populations,"
10 we've been doing that. What we have not had a
11 handle over, however, are all the other activities
12 that have been affecting the fish. And sadly, I
13 think within the three alternatives that are
14 presented here, all we're doing still is nibbling
15 around the edges. Nibbling around the edges.

16 This gets me into the third point about
17 assurances. We've heard from urban users that they
18 want to have guarantees, assurances that they're
19 going to have water no matter what. We've heard
20 from ag that we want to have assurances no matter
21 what. And, of course, all of those are projecting
22 also not just for their existing uses but some
23 growth with that.

24 Well, we'd like to have some assurances for
25 the fish, too. In years of good water supply in

1 California, in wet years, we produce fish. 1988
2 California produced 14 million pounds of Chinook
3 salmon in the commercial harvest alone. That made
4 California the biggest producer of Chinook salmon in
5 the United States, more than in Alaska, of Chinook
6 salmon. This is the finest salmon in the world.

7 We can do it when we have the water. We
8 cannot, however, do it when we don't have the water.

9 And we saw other examples, too. In 1991 as
10 a result when we first -- when we really began
11 feeling the impacts of the drought on the salmon,
12 production went to 1.5 million pounds. We need to
13 have assurances of water for those fish during dry
14 and critically dry years. We need to have the same
15 assurances everybody else does.

16 I should also point out that in state law,
17 it's state policy to double our salmon populations.
18 It wasn't CVPIA, this is California, a law signed by
19 Governor Deukmejian in '88 to double those
20 populations. That should mean that not only should
21 we be getting the water that's now needed for those
22 fish, but also an additional increment for the
23 doubling.

24 So those are some of the assurances that
25 should be taken into consideration out there before

1 we start planning for additional growth. Let's take
2 care of existing needs, and I would submit a number
3 of existing needs are not yet being met. And I
4 think we need to take a look at is there water for
5 those needs.

6 Now, we saw on the board the matrix here of
7 the no-action versus the three alternatives. I
8 think it's sort of misleading because no action
9 assumes that nothing is taking place. In fact,
10 actions are taking place. Actions are taking place
11 now under the Endangered Species Act.

12 What was good for the winter-run salmon is
13 sure as hell going to help us with fall-run by
14 providing cold water from Shasta Dam by lifting the
15 gates at Red Bluff, by perhaps restricting some of
16 the pumping when not only the winter-run are trying
17 to get to sea but also the fall-run salmon, which
18 are the mainstay now of not just California's ocean
19 fishery but Oregon's and Washington's as well, those
20 Central Valley Chinook salmon.

21 So there is action taking place, so don't
22 be deluded by thinking that there's nothing
23 happening. It's just the action may not be
24 happening directly through CalFed. However, I
25 should say that CalFed is helping.

1 CalFed can do more to help obviously, too,
2 in removing some of the structures, as Earl
3 mentioned, in Butte Creek and some of those other
4 places so we can began expanding from five percent
5 of our historic habitat which is left in the Central
6 Valley, which does precious little to try and --
7 when you're trying -- particularly trying to produce
8 natural-run salmon, and begin starting to increase
9 that so we can open up places like Butte Creek and
10 Battle Creek.

11 And this gets me to my fourth and -- and
12 last -- or fifth issue, and that is the San Joaquin.
13 Now, we've heard a lot of talk about we need to put
14 in some sort of canal or structure around the Delta
15 to help San Joaquin salmon. Well, again we're
16 nibbling at the edges.

17 If we're going to do something for
18 San Joaquin salmon, then you're going to have to
19 provide for releases out of Fryant Dam. No ifs,
20 ands or buts. You've got to re-water that river if
21 you're going to have salmon in the San Joaquin. And
22 to talk about putting canals around or trying to
23 take care of reverse flows, again that's nibbling
24 at the edges. The first and most basic thing you've
25 got to do for San Joaquin salmon is have water in

1 the river.

2 Thank you.

3 CHAIRMAN MADIGAN: Thank you, sir.

4 Ann?

5 MS. NOTTOFF: Yeah. I think that since
6 we're behind, although I think it's very important
7 finally this morning fish are having their due,
8 which is a very significant thing. But we have
9 our -- we're running the situation where we have a
10 couple of people, panelists, who were prepared to
11 talk this morning who are going to have to leave
12 soon. So I wondered if I could take some people out
13 of order and ask this panel to -- let's hold our
14 questions for this panel and bring in some -- the
15 next speakers.

16 I also noticed that Mike Cahill is here so
17 I don't know if you're ready to take him.

18 CHAIRMAN MADIGAN: Yeah, I -- I think
19 that's fine. I think we should get the next panel
20 organized but I would like to ask Mike Cahill to
21 come up to the microphone. Mike came over here this
22 morning and has some comments on funding strategies
23 that I think are important for us to hear.

24 Mike, thanks a lot for coming this morning.

25 Thank you all very much. We will be back

1 to questions.

2 Good morning.

3 MR. CAHILL: Good morning.

4 Let me just give a little background on the
5 funding issue. I mean a lot of this goes back to
6 the Governor's water strategy in 1992 where he laid
7 out ten points under the realization as far as
8 dealing with California's water problem, no one
9 solution is going to work, that we need to be
10 working on multiple front here.

11 And then now as we're moving towards
12 decisions along these areas, we're also looking at
13 the funding situation as we similarly have to be
14 moving cooperatively on how we're going to be
15 implementing these decisions. We really need a
16 partnership on the funding side as well between the
17 water users, the state and federal agency.

18 And similarly, as we go into funding we
19 have to -- as we make decisions, we have to be
20 recognizing that funding will have to move in tandem
21 on ecosystem issues and water quality, water supply
22 and water assurances for all sectors.

23 The other aspect on the funding picture is
24 really the timing. We have a lot a decisions that
25 are going to be made shortly, remarkably shortly

1 given the normal decision process in the water
2 world.

3 We certainly have CalFed as the
4 centerpiece. We also have the Colorado River 4.4
5 Plan which Michael assures us is going to be made
6 soon. We have beginning work on the Central Valley
7 review of the flood management systems there and we
8 have regional decisions such as the Owens Lake
9 agreement that are going to have implications
10 overall to the state's water picture.

11 From the Governor's perspective, we really
12 need to keep the momentum going on those decisions.
13 I mean they shouldn't be decisions that sit on the
14 shelf for two or three years while we get the
15 funding in place, but we need to begin the work now
16 on some of the more detailed study items, such as
17 environmental feasibility studies for storage such
18 that we'll have that information ready when those
19 decisions will be made on which storage and what
20 storage we need for a water supply environmental
21 purposes.

22 We also need to keep the momentum going as
23 we make the decision through the CalFed process both
24 on the Phase 1 implementation as well as what we'll
25 need as far as interim assurances on water quality,

1 water supply, and such that we have the money to
2 begin work on those as those decisions are made
3 through the CalFed process.

4 Now, as far as the Governor's request for
5 federal funding, this is really part of an overall
6 package. We already have the Proposition 204 and
7 the federal matching funds in place for the
8 ecosystem restoration site. You know we also have
9 the water bond, we're -- negotiations continue on
10 that.

11 That particular funding piece, the primary
12 funding components of interest to CalFed are, first,
13 major investments in the common facilities CalFed is
14 looking at, the conservation and recycling, water
15 quality, levees, also conjunctive use facilities are
16 still under discussion in that.

17 Similarly, discussions on providing the
18 fund -- the base investments on what will be needed
19 for the Phase 1 facility, the interim assurances
20 types of projects people have been talking about.

21 Really -- and similarly, under the water
22 bond, discussions are continuing providing a chunk
23 of funding for conservation measures will be needed
24 as part of the 4.4 agreement for the Colorado River.

25 On the budget side, a big chunk is moving,

1 although we previously had in the bond for payment
2 of (inaudible) funds to local flood control
3 districts moving that into the budget, funding to
4 carry through the actual CalFed operations,
5 something near and dear to Lester's heart, so that
6 we can complete the work based on the time extension
7 that was agreed to by the Governor and Secretary
8 Babbitt.

9 We have funding for the VAMP agreement as
10 far as the State Water Resources Control Board's
11 water rights decision. We have funding to create a
12 water transfer exchange, along with companion
13 legislation we're looking at facilitating short-term
14 water transfers. And then also funding to complete
15 the environmental and feasibility studies for
16 surface storage, doing the studies that will be
17 necessary for the eventual permitting decisions.

18 The federal letter then meshes in with this
19 just as with Proposition 204. We're looking to
20 continue a partnership with -- a federal match for
21 what the state and the user groups will be required
22 to put up for the Phase 1 facility. Specifically,
23 we've asked for a two-year authorization of \$147
24 million with an appropriation of \$67 million this
25 year.

1 As far as the status of that, fundamentally
2 the intent of the letter was to put a marker into
3 the process right now. We will be moving forward
4 first on the authorization front and really
5 focusing, as far as the appropriation on the
6 supplemental appropriations process, it probably
7 won't be until September.

8 The dollar amounts that we put in at this
9 point are based on the current discussions between
10 the state and federal agencies on the Phase 1
11 facility is really what we have already in the state
12 process to provide the state's share of that. But
13 the language itself has not been developed and that
14 we intend to develop in conjunction with our
15 discussions with the federal agencies as well as the
16 undergoing efforts. We have another arena such as
17 the budget numbers and the bond discussions. So I
18 think that's coming.

19 Overall again, what we're looking at is
20 this is going to be a very major effort just taking
21 CalFed in isolation, let alone what else we have
22 going on on water decisions in the state. This is
23 major effort over the next 20 to 30 years.

24 This is going to take continuing kind of
25 cooperative partnership efforts that the state, the

1 federal agencies, stakers have maintained to
2 continue making sure we have the resources to
3 actually act on these decisions rather than have
4 additional studies that simply sit on the shelf.

5 The timing is now and the needs are going
6 to be rather great, so it's something that we feel
7 we need to move forward on.

8 CHAIRMAN MADIGAN: Thank you, Mike.

9 Are there questions?

10 Tom?

11 MR. GRAFF: Mike, I have a lot of
12 questions --

13 CHAIRMAN MADIGAN: You get to ask two.

14 MR. GRAFF: -- but I know time is short
15 so I'll try to sort of go to the heart of the
16 matter.

17 Some of us raised questions about this
18 yesterday and we had some discussion about it. I
19 guess the most fundamental questions here among
20 many --

21 MR. CAHILL: Uh-huh.

22 MR. GRAFF: -- are -- relate to points
23 you raised in your remarks.

24 One has to do, I guess, with timing. In
25 our view, the Governor's letter of June 28th, that I

1 guess was generally released on Monday, prejudices
2 the appropriateness of a number of facilities and
3 the methods of financing those facilities well in
4 advance of any decision-making that's taken place in
5 CalFed that has even been discussed in serious ways
6 by this panel.

7 It purports -- the letter purports to be
8 that the California congressional delegation is
9 supporting this when, as far as I know, California's
10 two senators were not informed about it until Monday
11 and many in the congressional delegation who have
12 substantial interest in water were not informed
13 about it. So I guess the fundamental question there
14 is aren't you jumping the gun.

15 And then on the merits, you seem to say in
16 your remarks that the principal purposes here are
17 feasibility studies. But the specific language in
18 both the submitted -- what the administration
19 submitted to the state legislature for -- for -- in
20 the proposed trailer bill for state funding and in
21 the Governor's letter for federal funding includes
22 permitting and land acquisition.

23 MR. CAHILL: Uh-huh.

24 MR. GRAFF: It sounds -- it doesn't
25 sound like feasibility studies to me and I don't

1 think it's intended to be.

2 As you probably know, land acquisition has
3 been a major problem for CalFed. Various members of
4 the California congressional delegation have argued
5 strenuously against land acquisition in other
6 contexts because it's not voluntary, yet I assume
7 you're meaning here eminent -- use of eminent
8 domain, which is a pretty serious matter.

9 So on the merits, we would question the use
10 of federal or state funds for those purposes and
11 particularly in light of the fact that there's no
12 mention here of cost sharing by beneficiaries, one
13 of the crucial substantive principles, as I
14 understand it, that the financing effort here of
15 CalFed and BDAC have stated is what -- what is to be
16 expected when these facilities are built.

17 MR. CAHILL: I mean, I don't think, I
18 mean, any of those points -- I mean, again to the
19 extent of particularly the last few points, as far
20 as the actual language on what we'll be looking for
21 in the federal process, I mean, certainly those are
22 all the issues that have to be addressed.

23 Again, from the standpoint strictly taking
24 the federal level -- letter, when we're talking
25 about the feasibility studies and environmental

1 studies that lead to permitting, clearly that's
2 we're doing with Shasta Dam. A lot of work's
3 already been done there, how -- what we need to
4 continue to bring -- really bring those studies to
5 the point where the decision on whether we should
6 move forward with a project like that and what it
7 will take for the actual permitting.

8 On the land acquisition assignment, clearly
9 that's targeted towards the Madera Ranch conjunctive
10 use project where there are discussions going on
11 right now on the acquisition of that land between
12 willing buyers and willing sellers. And really,
13 that's looking at, is this an opportunity that the
14 federal government should take advantage of in
15 conjunction with users.

16 On the user -- user pays, user sharing, as
17 we discussed in the context of the budget proposals
18 was the bond proposals. I mean, clearly that's --
19 those are issues that will have to be incorporated.

20 And the whole issue on surface storage is
21 how do you bring these projects to a point where you
22 really can be making those decisions, when you get
23 to the actual point of permitting and construction
24 decisions where you really have the information to
25 kind of lay that off -- lay that out and get to the

1 agreement on how those costs should be distributed
2 as well as recovering whatever money has been put up
3 front for the permitting phase.

4 So I think -- again, I mean, the issues you
5 raise are ones that clearly are going to need to be
6 addressed and ones that we are quite willing to
7 address.

8 CHAIRMAN MADIGAN: Alex?

9 MR. HILDEBRAND: I'd like to point out
10 that, as Mike has indicated, there have been a lot
11 of efforts to have financing available when needed
12 for various aspects of the CalFed program.

13 I find it a little inconsistent to make a
14 big fuss over the Governor's allegedly jumping the
15 gun in respect to water storage which some people
16 don't want, whereas on the other hand we're putting
17 up money for -- \$20 million for land acquisitions
18 that have not yet been processed through the BDAC
19 and which are a concern to some of us because they
20 haven't been coordinated with the flood control
21 planning, similarly with water acquisitions.

22 So if we're going to get pure on this and
23 not do anything until everything is all settled, we
24 aren't going to have any money available when we get
25 it settled. So I feel that it's not inappropriate

1 to get the money on the line, and whether it gets
2 spent or not depends on what we decide when the time
3 comes.

4 CHAIRMAN MADIGAN: Tom, did you want --

5 MR. GRAFF: Yeah. The -- particularly
6 at the federal level, Alex, I don't think you would
7 want to go back there and testify to a congressional
8 committee that "Just give us the money here in
9 California and we'll figure out down the line what
10 to do with it."

11 The fact of the matter is Mike made mention
12 in his -- in his opening remarks that through a
13 comprehensive coalition consisting of most of the
14 interests represented here, and with the Governor's
15 leadership and the leadership of others, we managed
16 two years ago to not only pass the state proposition
17 but to obtain significant federal funding to assist
18 in much of the work of our CalFed effort. That was
19 430 million in federal monies over three years.

20 The first year unfortunately, we only got
21 85 million out of the authorized 143, and this year,
22 in the fiscal year that congress is now dealing
23 with, it looks like it's going to be substantially
24 less than that. If we now seek additional
25 appropriations from congress for these as yet

1 unclear purposes, will it come at the expense of
2 those Bay-Delta Security Act funds?

3 MR. CAHILL: No, I mean, clearly we're
4 going to be limited in how much California will get
5 total from the appropriations process. But I mean,
6 from our perspective that should not come at the
7 expense of what we already have for CalFed.

8 MR. GRAFF: More for CalFed?

9 MR. CAHILL: More for CalFed. We may
10 need to re-prioritize some of the other requests
11 that we've made of congress. But from our
12 perspective it should not be the CalFed money.

13 CHAIRMAN MADIGAN: Sunne?

14 MS. McPEAK: I was trying to actually
15 recall who testified specifically yesterday
16 afternoon on that item. Certainly, there were other
17 BDAC members, Mike, that made the point that part of
18 evidence of good faith and I viewed this
19 correspondence to the federal government as an
20 indication to have the partnership --

21 CHAIRMAN MADIGAN: Uh-huh.

22 MS. McPEAK: -- between the state and
23 the federal government furthered and memorialized in
24 a way to move forward on a variety of fronts of the
25 potential components of an overall solution to

1 CalFed.

2 But part of that good faith that I heard
3 come out yesterday is the funding for existing
4 obligations and funding for components of the CVPIA
5 not get eroded. And I think -- it occurred to me
6 that that was something that I know the business
7 community could also speak out on in order to try to
8 better ensure folks that it wasn't a switch in bait.
9 Nobody used that term yesterday. And I was the one
10 defending everybody acting in good faith, you know,
11 the expectation that really we're all trying to work
12 together.

13 But I mention that because that was
14 something I picked up that I'm going to take back
15 and try to work on. And I think a similar effort
16 that gets expressed from the state side, including
17 from the Governor's office --

18 MR. CAHILL: Uh-huh.

19 MS. McPEAK: -- would probably help
20 underscore the help underscore the commitment to the
21 previous obligations.

22 MR. CAHILL: Yeah, I mean, clearly, I
23 mean we're not going to make progress if we're just
24 switching around the pots of money. I mean, we're
25 not exactly at the point where we're flagging down

1 every passing train with bullion in it. But we
2 clearly need to be looking for all the opportunities
3 to where we can put together financing from multiple
4 sources if we're going to complete the work that's
5 really being laid out now.

6 And it's something where we need to keep
7 adding to and not suddenly taking something we've
8 got in hand and now redirecting to someplace else.

9 MS. McPEAK: A follow-up the question --
10 and I invite anybody to answer -- that this just
11 occurred to me, yesterday Patrick Wright was here,
12 he isn't here today, but representing EPA, and
13 Patrick also addressed this issue stating that EPA
14 was committed to the storage studies going forward.

15 MR. CAHILL: Uh-huh.

16 MS. McPEAK: I think at the heart of a
17 lot of this concern is are we -- as you heard from
18 Mr. Graff, are we prejudging the outcome of CalFed.
19 Some of us think that there should be -- the studies
20 go forward. Others think that even the studies are
21 premature.

22 MR. CAHILL: Uh-huh.

23 MS. McPEAK: But assuming that we are
24 looking at trying to get information that will
25 inform an ultimate decision with respect to storage,

1 even Patrick Wright from EPA said, "We think that
2 those studies should go forward."

3 The question I'm going to pose to someone,
4 because I was struck by this letter from the state
5 to the speaker suggesting Shasta because it's a
6 federal facility --

7 MR. CAHILL: Uh-huh.

8 MS. McPEAK: -- would there be any
9 reason why if the federal government were interested
10 in furthering studies, that it could be a joint
11 effort around some other site. And we are, as you
12 were just saying, debating right now a bond measure
13 that has a lot of very good stuff in it for better
14 water management --

15 MR. CAHILL: Uh-huh.

16 MS. McPEAK: -- and efficient water use,
17 including conjunctive use. I personally think
18 Madera Ranch has a lot of value.

19 I have publicly said in other meetings I
20 don't know how to further that --

21 MR. CAHILL: Uh-huh.

22 MS. McPEAK: -- without being in the
23 middle of a negotiation over land value, because
24 that's what it comes down to. So I end up
25 defaulting back to the position of just saying,

1 "Whoever is an interested party, go get it done
2 because it seems like a percolation four times that
3 we find anywhere else. It's a pretty good deal."

4 And we all talk about groundwater banking
5 as a part of the water management stuff.

6 MR. CAHILL: Uh-huh.

7 MS. McPEAK: So since we're talking on
8 the state side about a bond measure that includes
9 conjunctive use --

10 MR. CAHILL: Uh-huh.

11 MS. McPEAK: -- there would be nothing
12 that would prevent, I think -- this is all in the
13 form of a question, Mr. Chair, although it doesn't
14 sound like that.

15 CHAIRMAN MADIGAN: It's an interesting
16 one.

17 (End of tape)

18 MS. McPEAK: -- there would be nothing
19 that would prevent in theory the federal government
20 joining as a partner and looking at these facility
21 studies by matching what we might be doing in
22 offstream storage that would be matching what we're
23 looking at generally in conjunctive use without
24 calling out a specific project.

25 Is that true? Does anyone want to respond

1 to that?

2 MR. CAHILL: Well, let me respond to it
3 just quickly. I mean -- I mean, if you look at the
4 language in the letter, we use those two simply as
5 examples. We don't specifically say we want money
6 for Shasta and Madera. We put those in because
7 those are clearly two projects that are under active
8 discussion, as well as they're the types of projects
9 that have other benefits other than what CalFed is
10 looking at them for directly.

11 As I said, we don't have language together
12 yet. I mean, part of what we want to get a response
13 from the congressional leadership on how feasible
14 they thought this request was, what kind of
15 direction, if we move on it, they'd like to see.
16 But similarly we want to keep the language so that
17 it does tie in with the overall discussions we are
18 having with the federal agencies.

19 So if there's other options out there,
20 there's directions the people feel that they should
21 go, our interest is making sure we have a federal
22 financial commitment to go on with the partnership
23 we have with them now.

24 CHAIRMAN MADIGAN: Okay. Thank you very
25 much, Mike. I surely appreciate your taking the

1 time to come over and join us today and brief us.

2 Thanks a lot.

3 Ann, you're back.

4 MS. NOTTOFF: Oh, it's Barry Nelson we
5 were going to get.

6 CHAIRMAN MADIGAN: Yeah.

7 MS. NOTTOFF: Yeah, we have -- we had
8 three -- four more --

9 CHAIRMAN MADIGAN: Go ahead.

10 MS. NOTTOFF: -- panelists that we asked
11 to --

12 MS. McPEAK: Ann, I'm -- I apologize for
13 interrupting you, and if Mike is still out there,
14 could you grab him because Barry Nelson also wanted
15 to comment during this time.

16 I do apologize to you, Barry and Mike.

17 MS. NOTTOFF: Okay.

18 MS. McPEAK: Mr. Nelson.

19 MR. NELSON: Thanks, Sunne and Mike.

20 I will be brief. I just wanted to provide
21 a couple of comments and two questions with regard
22 to the Governor's new proposal.

23 First, I think it's important to put it in
24 the context that we're really dealing with today,
25 and that is that the Governor first surprised us

1 with a bond act proposal, then a budget proposal,
2 now a federal appropriations proposal, which we're
3 frankly struggling to keep up with.

4 I wanted to point out the budget language
5 that's on the table now in Sacramento. That
6 language calls -- would provide funding not just for
7 studies and permitting but potentially for land
8 acquisition and even for construction of surface
9 facilities. And I think that's particularly
10 inappropriate. Tom mentioned that these actions
11 would prejudice the process. I think that's very
12 clear.

13 The question I'd have for Mike would be if
14 the state provides \$67 million to pursue surface
15 storage, and if the federal government provides up
16 to perhaps another \$140 million to pursue surface
17 storage and some other issues, but including surface
18 storage, if CalFed concludes that surface storage is
19 not called for and if the state and federal
20 governments have spent a good chunk of that funding,
21 is the state prepared to say that surface storage is
22 entirely uncalled for?

23 This would be an enormous investment in
24 surface storage. Frankly, I question whether given
25 that investment it would be possible for CalFed to

1 conclude surface storage was not necessary.

2 The second point I just want to make
3 briefly is that every one of the stakeholders, not
4 just my organization but every stakeholder is now
5 trying to frankly scale back its involvement in
6 CalFed in order to deal with a bond act, a state
7 budget and now a federal budget issue. It's
8 directly pulling resources out of this process.

9 And it's not just pulling them out of this
10 process, it is -- it is prejudging the process.
11 CalFed has billed itself as the new way of doing
12 business and, frankly, the Governor's proposals is
13 the old way of doing business. Somebody proposes a
14 dam and we all go off and fight about it. CalFed is
15 supposed to be pursuing a different track.

16 There were a couple of comments yesterday
17 about whether the Governor's proposal was prejudging
18 this process. And I said -- not prejudging but
19 bypassing this process.

20 And I actually have a question for everyone
21 around the table here, and that is, who around this
22 table, federal agencies, ag stakeholders, urban
23 stakeholders, environmental and fishing
24 stakeholders, who around this table participated
25 with the Governor in the preparation of this

1 proposal?

2 I'd be interested to hear who did
3 participate but unless that was pretty broad
4 participation, I think it's pretty hard to make a
5 straight-face case that this did not bypass the
6 CalFed process.

7 I'll simply close by saying that --
8 suggesting that what we need now in CalFed is
9 leadership that strengthens the agencies and
10 stakeholders around this table and doesn't pull us
11 all away from this table. And I invite the Governor
12 to withdraw his June 28th letter and to engage with
13 us within the CalFed process.

14 Thank you.

15 CHAIRMAN MADIGAN: Thank you, Barry.

16 Ann?

17 MS. NOTTOFF: I'm going to ask the last
18 four speakers to all come up to the table here, and
19 according -- this is -- I thought -- what we asked
20 today is people give you some semblance of some of
21 the issues that -- environmental issues that are
22 affecting the Bay itself, and then a couple of
23 people are going to talk about some alternative ways
24 of doing business and some examples of success
25 stories in conservation.

1 We're going to start out with -- because of
2 time constraints, we're going to start out with one
3 of those success stories and then we'll move down
4 the table here.

5 In his absence, I'll just say that I'm
6 going to name this the "Bob Raab Memorial Put the B
7 in the Bay Delta Panel" so -- there you go.

8 MR. BRION: Good morning.

9 CHAIRMAN MADIGAN: Good morning.

10 MR. BRION: Sorry for asking to be taken
11 out of turn. I'm supposed to be somewhere else at
12 11:00 so I think I'm a little late.

13 CHAIRMAN MADIGAN: Thank you for staying
14 this long.

15 MR. BRION: Yeah.

16 My name is Craig Brion (phonetic). I've
17 worked for the last five years as the advocate for
18 the Santa Clara Valley Audubon Society and I work
19 very closely on a lot of development issues in the
20 region, plus a lot of the water district's concerns.

21 I'm going to talk a little bit about how
22 that five years has shown me that some of the
23 solutions and some of the directions that I think
24 you should be going in are already occurring. Our
25 region, for a variety of reasons, has faced some of

1 the issues that you and many other communities
2 around California will have to face.

3 Much of it comes down to what I call the
4 remarkable fact which is that Santa Clara County is
5 consuming no more water now than we did roughly ten
6 or more years ago.

7 If you look at the graph of water
8 consumption in Santa Clara County, it peaks around
9 1985 to 1988 at around 400,000 acres feet or so. It
10 goes down during the drought, but after the drought
11 it does not jump back up to previous levels. It
12 jumps -- it comes very slowly to a point to where
13 now we are back at those historic high levels.

14 But that means that we have gone more than
15 ten years in the Silicon Valley area through some of
16 the greatest boom time economy that this state has
17 ever seen, adding hundreds of thousands of people,
18 jobs, companies to the region, and we are consuming
19 no more water now than we did then.

20 Now, the drought in the early '90s was only
21 part of that. What it really has been is that we
22 have adopted a drought mentality since then as well.
23 When the drought ended, we did not end our
24 conservation advertising in newspapers, radio,
25 television. We did not end our programs of rebates

1 on ultra low-flow toilets and other water-efficiency
2 measures.

3 We essentially maintained that California
4 is in a state of perpetual drought if that is
5 defined as supply not meeting everybody's desires.
6 And we have maintained an attitude that says that we
7 will, are and will remain in a drought mentality
8 until -- for as long as we need it. And that will
9 probably be forever.

10 One of the most interesting results of
11 recently has been the water district's integrated
12 resource plan which was done in 1996. I have been
13 involved in a lot of stakeholder processes in my
14 five years or so with Audubon, probably about a
15 dozen or so. It has led me to often lecture on the
16 value of benevolent dictatorship over consensus
17 processes. I don't think that many of them are very
18 successful, at least not in the time spans and with
19 their goals. But this one worked.

20 Our time span was March to November of
21 1996. We met that time. Our goal was that in
22 critical dry years our region by the year 2020,
23 given development scenarios, could be up to 100,000
24 acre feet short of water. In wet to normal years,
25 we're going to have an adequate supply most likely

1 even given the development scenario of our area.

2 But in those dry years we have about a
3 100,000-acre foot shortfall. So the group was
4 supposed to come up with a package of concer -- of
5 proposals from a menu, a very large one that we were
6 given, that would fill that 100,000-acre foot gap.
7 And we did that in the six or eight months that we
8 had.

9 Once we did it, it took only two months for
10 the water district board to unanimously adopt our
11 proposals and the process simply worked extremely
12 well.

13 What we came up with from this huge menu of
14 possibilities was a package that emphasizes four
15 things: Water banking, recycled water, demand
16 management of conservation and long-term transfers.

17 Now, there were 21 people around this room,
18 only two of us representing the environmental
19 community, and that was the package we came up with.
20 That included people from the irrigation companies
21 around our area, three members from the business
22 community, the Farm Bureau, the Cattlemen's
23 Association, two or three members from local
24 government, regional/local water supplies agencies,
25 any number of these people.

1 And we all came to this conclusion of water
2 banking, recycled water, demand management and
3 long-term transfers was the answer for our region to
4 the year 2020.

5 Prior to that, several -- a few of the
6 water district board members had been leaning in
7 favor of a new storage reservoir in our county, most
8 likely in the Coyote Creek system, very valuable
9 habitat.

10 That was given almost from the outset by
11 this group very low priority for good reasons:
12 Costs, the inflexibility of committing to a dam and
13 not being able then to adapt to situations, changes
14 in demand over time, the uncertainty of the
15 permitting process and the environmental impacts.

16 Essentially, once people were explained
17 that these other things had been working, as I said,
18 not increasing our water consumption in ten years,
19 some of these other tools had been working and many
20 of these tools like banking could work to fill that
21 gapped supply, people realized that we could come to
22 a cost-efficient and environmentally very low-impact
23 solution despite -- once again, despite the fact
24 that we project booming growth for the next 20
25 years.

1 We are perhaps lucky or unlucky in that we
2 are being forced to deal with these issues faster
3 than most other communities because of our
4 wastewater problems as well. Our conservation
5 efforts, our height and our recycled water efforts
6 are mandated by the fact that our flows to the Bay
7 are harming endangered species there, much as some
8 of the mandates you're working under here.

9 But I think some of the lessons of the
10 recycling that we're doing, the conservation that
11 we're doing -- and I don't have time to go into
12 specific programs, but they're well worth taking a
13 look at -- are going to be the exact situations
14 faced by many communities around the state and we
15 are already solving many of their problems in an
16 area where you could probably say the problems are
17 virtually the most difficult to solve due simply to
18 our development scenario and our placement in the
19 bottom of the Bay, a very sensitive environmental
20 area.

21 Finally, I just wanted to quote a bit from
22 an article I wrote to our membership last year, and
23 I think it's still roughly the same opinion that I
24 have. I talked about the possible changes due to
25 the CalFed process and I said that two simplified

1 versions of our potential futures look like this:

2 No. 1, an honest attempt is made to reform
3 water rights, pricing, delivery and consumption and
4 to balance the needs of California's growing
5 populations with the needs to restore a remarkable
6 ecosystem.

7 Or, No. 2, the environment and
8 environmentalists are bribed with insufficient
9 restoration dollars into living with the decision
10 that increases the ability of agriculture and urban
11 areas to slake their unending thirst, leaving just
12 enough water for habitat in the Delta to stave off
13 complete collapse, while continuing the stupidity
14 freshwater policies of the past.

15 I believe that Santa Clara County has
16 already, at least locally, faced some of these
17 issues and is making a lot of the right choices, and
18 I think that you have the opportunity to influence
19 the rest of the state to do the same.

20 Thanks. Sorry, I must go.

21 CHAIRMAN MADIGAN: Thank you very much.
22 Thanks for your time this morning.

23 Out of here. Okay.

24 Yes, ma'am, good morning.

25 MS. SCHAEFER: Good morning. Can you

1 hear that all right?

2 My name is Nancy Schaefer (phonetic). I'm
3 the coordinator of a project called the
4 San Francisco Bay Joint Venture, which is a
5 public/private partnership of public agencies,
6 environmental organizations, business and
7 agricultural representatives working to increase the
8 amount of wetlands around San Francisco Bay.

9 My job here today was to talk about
10 wetlands losses, but I sort of want to take a bad
11 news/good news approach. There have been a lot of
12 wetlands lost in the Bay but there are a lot of
13 efforts that are ongoing to address those losses.

14 Now, a lot of the information that I'm
15 giving you today is coming directly out of the
16 San Francisco Bay Regional Wetlands Ecosystem Goals
17 Project. This has been a three-year process with
18 over 100 scientists from state agencies, federal
19 agencies, universities and nonprofits as well to
20 come up with goals for the various types of habitats
21 in San Francisco Bay.

22 Peggy Olafson (phonetic) with the regional
23 board is here. Somewhere. There she is.

24 If you have any specific questions about
25 the Goals Project, I encourage you to address them

1 to her. She spent a lot of time pulling these
2 together as the project manager on this enormous
3 task.

4 What they've done is they've looked at the
5 needs of a whole variety of species, a whole suite
6 of species that uses the wetlands complex of the
7 Bay, fish, invertebrates, mammals, birds, and come
8 up with habitat recommendations. This draft was put
9 out in late June and this past week there's been
10 public workshops on it. Peggy's probably delirious
11 from that so you might want to hold off on your
12 questions until she's recovered.

13 I had planned to put up some big maps but
14 in the interest of time, what I'll do is just
15 highlight where some of these things can be found
16 hopefully in this packet that you've received.

17 What's in the packet is a map that was
18 prepared by the San Francisco Estuary Institute in
19 support of the Goals Project. It shows the
20 historical view of wetlands distributions and the
21 modern view.

22 And you can see that there's been --
23 there's been enormous losses. It's approximately
24 150,000 acres that have been lost of tidal marsh.
25 This doesn't include non-tidal marsh, riparian,

1 vernal pools and other seasonal wetlands because
2 that information has not been as well documented.
3 It's difficult to come up with those numbers.

4 So bear in mind we're talking 150,000 acres
5 of tidal marsh. We don't know exactly what the
6 losses are in seasonal marsh. But if you look at
7 some of our -- our creeks and rivers, you get a
8 sense that there's been enormous losses there as
9 well.

10 The role of the joint venture then, and
11 this is part of the good news, the role of the joint
12 venture is to implement the goals through
13 acquisition and restoration. And we're taking the
14 goals in numbers and increasing it because we cover
15 a slightly larger geographic area. And then we're
16 trying to figure out ways to actually implement
17 these goals, whether it's meeting with landowners,
18 coming up with private incentive programs or trying
19 to get additional funds for public acquisition of
20 properties.

21 There are four major areas that the Goals
22 Project has addressed: Suisun Marsh, North Bay,
23 Central Bay and South Bay. I just want to briefly
24 run through some of these areas and talk about the
25 losses.

1 In Suisun Marsh we've lost about 65 --
2 we've gone from 65,000 acres of tidal marsh down to
3 9,000. A lot of this is in managed seasonal marsh
4 which is actually good habitat for waterfowl. This
5 is not something we want to screw around with too
6 much, but there is a need to restore some tidal
7 marsh in the area. And the Goals Project has come
8 up with a recommendation to increase tidal marsh in
9 Suisun Bay -- or Suisun Marsh area, and this also
10 includes the Contra Costa shoreline as well, from
11 9,000 to 30 to 36,000 acres.

12 There's a lot of different ways this can
13 occur. Working with some of the private duck clubs
14 to enhance some of the habitats on their properties.
15 On the Contra Costa shoreline there's a lot of work
16 being done by East Bay Regional Park District and
17 the Contra Costa Mosquito Abatement District, of all
18 organizations. They've been very active in
19 restoring tidal marsh, particularly on the Concord
20 Naval Weapons Station.

21 And they're in the process of installing a
22 high-tech tide gate at Shell Marsh as we speak
23 called the Necktime Gate that will improve tidal
24 flows. Don't you love that, Necktime Gate? Sounds
25 like something out of Star Trek. Anyway, it will

1 improve tidal flows to Shell Marsh.

2 In the North Bay, the loss has been
3 something like 71 percent of tidal marsh, mostly due
4 to diking and draining for agricultural purposes.
5 The Goals Project has set a goal of -- to increase
6 tidal marsh from 16,000 to 37,000 acres. Some of
7 this can be accomplished on lands that are already
8 in public ownership that just need some restoration
9 work.

10 For example, Culligan Ranch (phonetic) has
11 been in the ownership of the Fish and Wildlife
12 Service for a number of years but due to funding and
13 technical difficulties, it has not been restored to
14 tidal marsh yet. And that -- that is under way.
15 And in fact, a CalFed grant did go to Culligan Ranch
16 to help with the restoration.

17 Also the Napa River, another CalFed grant,
18 a million dollars went to that project. The City
19 and County of Napa have come up with a very
20 innovative approach to flood control on the Napa
21 River, setting back levees, acquiring properties,
22 restoring habitat to those areas.

23 Moving on to the Central Bay. Central Bay
24 historically did not have a lot of tidal marsh but
25 they've still lost 90 percent of what they had and

1 riparian areas are pretty well trashed. Those that
2 haven't been put in culverts are pretty well
3 trashed, put it that way.

4 The Goals Project is only making a
5 recommendation of a few hundred acres for tidal
6 marsh because the opportunities are somewhat
7 limited, and yet there are still restoration
8 projects going on.

9 For example, the Port of San Francisco is
10 restoring about 15 acres at Pier 98 in the
11 Bayview/Hunters Point area, the park service is
12 restoring Christie Fields (phonetic), 20 acres.
13 Their efforts to restore tidal action to Lake
14 Merritt and also, for example, there are a lot of
15 efforts to restore creeks, Salzo Creek (phonetic) in
16 Oakland, Codinices Creek (phonetic) in Albany.

17 Moving down to the South Bay, the losses
18 have been about 84 percent of tidal marsh. Now,
19 this area has not been diked and drained for
20 agriculture, it's been used for salt production.
21 Out of the approximately 75,000 acres of Bay lands
22 in that area, 20,000 fortunately is under the
23 ownership of the San Francisco Bay National Wildlife
24 Refuge so it's managed by the service.

25 Another 30,000 acres or so are still in

1 private salt production, which isn't necessarily a
2 bad thing. It does provide a lot of quality
3 shore -- not quality but -- some of it's quality
4 shore bird and waterfowl habitat. But the Goals
5 Project is hoping to go from 9,000 acres of tidal
6 marsh existing to 24 to 29,000 acres of tidal marsh.

7 Now, some examples of projects that are
8 under way down there Bear Island, I think a lot of
9 you have heard a lot about this, Peninsula Open
10 Space Trust became local heroes when they purchased
11 this property for 15 million and are trying to come
12 up with -- their fund-raising five million privately
13 and working to get ten million in the federal and
14 state appropriations to put the property in the
15 ownership of San Francisco Bay National Wildlife
16 Refuge. And we have already secured enough funds to
17 begin enhancement planning on the process --
18 training on the 1500 acres to restore it to tidal
19 marsh.

20 Mira Loma and Heyward, 364 acres that was
21 recently restored to tidal march and seasonal
22 wetlands. Arrowhead Marsh, Port of Oakland, Coyote
23 Creek, Alameda Creek, all of these areas have
24 watershed plans under way on them and they're in the
25 process of being implemented.

1 So to summarize, then, the Goals Project is
2 basically looking at -- and again I want to
3 emphasize this is still in draft form, these will be
4 refined as time goes on -- is recommending an
5 increase of 60,000 acres of tidal marsh in
6 San Francisco Bay and including Suisun Marsh. They
7 also recommend more freshwater flows.

8 Now, as I mentioned, the goal of the joint
9 venture is to implement the Goals Project. And some
10 of the ways that we're doing that is by assisting
11 with all the projects that are under way. This map
12 with all these little tiny projects on it gives you
13 an idea of the approximately 40 to 50 projects that
14 we're tracking and trying to assist with the
15 completion of.

16 Our early estimates of what we need to
17 implement the goals is \$20 million over the next
18 20 -- for each of the next 20 years. Now, we're
19 looking at both private and federal and state
20 sources for those.

21 And there's another sheet in your packet
22 called the Wetlands Restoration Program. It talks
23 about the losses, what we're trying to do and the
24 various sources of funds that we're looking at.
25 CalFed is one of those funding sources that we're

1 looking at. We don't expect CalFed to be the answer
2 to the Bay's problems but it is a very large sum of
3 money going to ecosystem restoration.

4 It would be nice if the Central and South
5 Bay were included in the Ecosystem Restoration Plan
6 so that as this 20-year ecosystem plan is
7 implemented, funds would be available for projects
8 in the Central and South Bays.

9 Part of the reason I have to run is because
10 another funding source that we're looking at is the
11 Land and Water Conservation Fund, and there's a
12 panel this afternoon that we've set up to come up
13 with the regional strategy for land and water.

14 So we don't want you to think we're looking
15 to you for all the answers. But we do want to make
16 a strong recommendation that the Ecosystem
17 Restoration Plan incorporate the goals.

18 Thank you.

19 CHAIRMAN MADIGAN: Thank you very much.
20 This is very helpful.

21 Ann?

22 DR. LUOMA: My name is Sam Luoma
23 (phonetic). I'm part of a team of scientists at the
24 U.S. Geological Survey who have been working on
25 San Francisco Bay and the Delta since the mid-1960s.

1 And my role here today is to talk a little
2 bit about the science that supports the concept that
3 if we're going to have a fully successful San
4 Francisco Bay and Delta restoration program, one
5 that reaches its full potential, it will require a
6 full ecosystem view.

7 If there's one thing we can conclude from
8 our studies, again, our 30 years of studies in this
9 ecosystem, it's that the embayments of the San
10 Francisco Bay system are tightly interconnected and
11 that what you do in one part of the Bay has great
12 implications for what you do -- for what happens
13 elsewhere in the Bay.

14 So both the implications of management
15 associated with the decisions that are made here and
16 the restoration program need to include
17 San Francisco Bay at least from the science that
18 we've -- that we've looked at.

19 I'd like to show a couple of slides, if I
20 could, to go along with that and I'll -- Ann can
21 just cut me off at any point if I -- if I go on too
22 long. I'll try not to.

23 There are two points I want to make. First
24 of all, San Pablo Bay, South Bay and Central Bay
25 have immense expanses of shallow-water habitat and

1 in some cases a lot of -- as we've heard about, a
2 lot of potential marsh to develop. Actually,
3 historically two of the largest and most successful
4 fisheries in the Bay area were associated with those
5 habitats at one time.

6 The Oyster Husbandry Fishery of the late
7 1800s was the largest fishery in California at that
8 time. It collapsed in the early 1900s. The
9 Dungeness Crab Fishery supported around the Farallon
10 Islands was a very successful fishery supported by a
11 nursery in San Pablo Bay. Again, that collapsed in
12 1960.

13 So if we're going to take full potential or
14 take full advantage of the -- of the potential for
15 restoring the San Francisco Bay and Delta ecosystem,
16 it seems to make sense that we take advantage of the
17 expanses of potential habitat we can restore in
18 these parts of the Bay itself.

19 The second point and perhaps the most
20 important point -- sorry.

21 Thanks.

22 Okay. The most important point is that the
23 complex of interconnected embayments, sloughs,
24 marshes and channels and rivers in the estuary are
25 very tightly connected.

1 They're connected by the flow of water.
2 They're connected by the movement of particulate
3 material both up and down the estuary. They're
4 connected by the movement of carbon, which is the
5 base of the food web, you can't make fish without
6 carbon. And carbon flows through the system in this
7 system as I'll show in a second.

8 They're connected by the movement of
9 animals from all the bays to one another and they're
10 connected by water quality issues. Bad water
11 quality in one part of the Bay can affect the
12 success of fisheries in another part of the Bay.

13 So again I'd like to show just a couple
14 examples of those, if I could.

15 Obviously, the quantity of fresh water that
16 comes into the San Francisco Bay system from the
17 Sacramento River and the San Joaquin River
18 determines the salinity gradient that we see through
19 Suisun, Carquinez Straits and Pablo Bay and the
20 Central Bay.

21 This year in 1997 with the El Nino, we
22 actually saw fresh water at the surface in Central
23 Bay for a period of time. As water diversions have
24 increased over time, in low-flow years we actually
25 find increases in salinity have occurred

1 progressively at the Golden Gate.

2 The organisms that live in the estuary are
3 tightly adapted to this changing salinity regime
4 obviously. So when we manage water in the
5 estuary -- in the rivers and the Delta, we're
6 managing the salinity gradient in the whole estuary.
7 And that doesn't just end right here in Central Bay
8 because the inflow of water from the Delta also has
9 huge implications for South San Francisco Bay.

10 In 1995, in a simplistic example, we found
11 water hyacinth floating down here around the
12 San Mateo Bridge during high flows. Well, the only
13 place you can get water hyacinth in this system is
14 upstream in the San Joaquin River. Obviously, that
15 water hyacinth had not only floated all the way
16 downstream but it floated down fast enough to get
17 there before it -- before it decayed away.

18 In a more sophisticated sense, every year
19 the South Bay is flushed by the high flows from
20 the -- from the North Bay as long as those flows
21 exceed 40,000 cubic feet per second.

22 So the South Bay sits down here as a
23 relatively stagnant embayment which receives
24 millions of gallons of wastes from our surrounding
25 cities, although fairly well treated, still millions

1 of gallons of waste per day, and that water has a
2 residence span of something like 160 days, about
3 four months, during the summer.

4 When the flushes come from the North Bay,
5 that water turns over, it reinvigorates the South
6 Bay system. And, again, when you're managing fresh
7 water up here, one is managing the quality of South
8 San Francisco Bay.

9 Particles in an estuary actually move
10 upstream under certain flow regimes. We know that
11 because when we thought about dumping dredge spoils
12 off Alcatraz, the assumption was that all those
13 would go out to sea. Now we know, of course, that
14 most of those dredge spoils go about back to where
15 they came from.

16 The major particles here in Suisun Bay in a
17 hydrodynamically crucial portion of Suisun Bay and
18 ecologically crucial, actually come from San Pablo
19 Bay is what we've learned recently.

20 When we study sediments up here in
21 Rio Vista, we're actually looking at the industrial
22 signature in the summertime of those sediments from
23 Suisun Bay. So throughout the system, the Bay is
24 interconnected not only by downstream flow of water
25 but also by upstream flow of water and particles due

1 to the complexities of hydrodynamics.

2 The most important factor in an estuary in
3 terms of producing fish, the basic fundamental
4 limiting factor is carbon. We see, if we look at
5 correlations across lakes, estuaries and the oceans,
6 the amount of fish that you produce is tightly
7 correlated to the amount of carbon that's produced,
8 the amount of nutritious carbon that's produced.

9 The range of carbon production across all
10 estuaries is from 6 to 600 grams carbon per meter
11 square per year. It means about 150 to 200.

12 North San Francisco Bay, Suisun Bay and
13 San Pablo Bay is very poor at producing carbon.
14 This is what we produce in North San Francisco Bay
15 as best we can tell, San Pablo Bay and Suisun Bay,
16 about 20 grams of carbon per meter square per year.
17 150 to 200 is the average. We're about 10 percent
18 of the average estuary.

19 That puts a ceiling on what your fisheries
20 can produce unless you can get the carbon from
21 somewhere else. In North San Francisco Bay the
22 source of carbon is the rivers. And that source of
23 carbon is tightly linked to river flow.

24 This -- my wife told me that if I did this
25 it would glaze everybody's eyes, but I'll still show

1 you the correlation.

2 (Laughter.)

3 The annual mean -- this is annual mean
4 river flow on the X Axis, this is nutritious carbon
5 or algo-derived carbon from the rivers. On the Y
6 Axis it shows is the tightness of the correlation
7 between river flow and carbon input to Suisun Bay
8 and San Pablo Bay.

9 When we're managing river flow, we're
10 managing the nutrition for Suisun Bay and for San
11 Pablo Bay that will determine how much fish can be
12 produced in those systems. The linkage between the
13 inflow of this nutritious material and the
14 production of organisms in those systems is tight.

15 Well, by the time river water gets to South
16 Bay all the way down here, most of the nutritious
17 carbon has been consumed. Nevertheless, river
18 inflows are crucial for managing the production of
19 the South Bay fisheries. Every year in South Bay --
20 in South Bay the primary source of carbon is
21 produced internally.

22 In this case, there's enough production of
23 phytoplankton, that is, the tiny plants that can
24 take nutrients from the water column and sunlight
25 and turn them into -- turn them into nutrition --

1 nutritious carbon. There's a phytoplankton bloom in
2 South Bay that occurs once a year every year for a
3 two-week to six-week period, and that produces about
4 70 percent of the material that feeds that Bay for
5 the whole year, for each year.

6 That phytoplankton bloom occurs when
7 freshwater flow penetrates into South Bay. It's
8 tightly coupled to the river flow in the Delta. And
9 in years of high river flow, 1983, we get a lot more
10 carbon. In years of low river flow, we look here
11 like at 1992, one of our lowest river flow, we get
12 low carbon.

13 This year in an El Nino year we've never
14 seen so much carbon produced in South Bay in all our
15 years of study -- in all these years of study.

16 Again, the important thing is that when
17 you're managing water in the North Bay, you're
18 managing the South Bay and the tight coupling of the
19 ecology of the South Bay.

20 Finally has to do -- another issue is our
21 water quality issues. This slide shows selenium
22 concentrations -- selenium contamination and it's
23 spread through Suisun and San Pablo Bay.

24 Traditionally, the primary sources of
25 selenium in this system have been around Carquinez

1 Strait at the refinery. Selenium, of course,
2 threatens the health of two of our most important
3 organisms in the Bay, sturgeon, white sturgeon and
4 scutter which live in San Pablo Bay, and this slide
5 is just to show that even a single source of
6 contamination in this part of the estuary can affect
7 both this part and this part.

8 This selenium issue is also important from
9 the point of view of water management, though, also
10 because as a second source of selenium in this
11 system is the San Joaquin Valley, of course, as we
12 all know. That's been a really recalcitrant
13 problem.

14 Well, when we think about solutions, water
15 management solutions, some of those solutions
16 involve changing the balance between Sacramento and
17 San Joaquin water, bringing more San Joaquin water
18 into the system. Until we think about the solutions
19 to both the pesticides and the selenium problems in
20 the San Joaquin, we've got to think about the
21 implications all through the Bay of bringing more
22 selenium-laden water into the system.

23 Finally, the parts of San Francisco Bay are
24 coupled -- are interconnected by the fish
25 communities themselves. These are bullets taken

1 from -- and I won't go through all of them -- but
2 they're bullets taken from the San Francisco Estuary
3 Project Status and Trends of Resource Species
4 written by Bruce Serbo, Alan Jaspe and Peter Moyle
5 (phonetic).

6 And they talk about the fish community in
7 Central Bay, San Pablo Bay and Suisun Bay and how
8 they're each -- in each case they're a mixture of
9 fish. For example, in Central Bay they come from
10 the ocean, the South Bay and the freshwater regions
11 to the north.

12 San Pablo Bay, which we know very little
13 about ecologically, but what we do know is that it's
14 got -- it's got a very diverse fish community that
15 can tolerate a range of salinity. In the summertime
16 fish come in from the ocean, the South Bay. In the
17 winter during high flow, fish come in from upstream
18 during low salinity. As I mentioned, San Pablo Bay
19 was the nursery for our successful Dungeness Crab
20 Fishery.

21 Anadromous fish including shad, salmon and
22 striped bass make their way through the -- through
23 San Pablo Bay. As a matter of fact in the 1970s
24 striped bass fishery, one of the things that limited
25 the anglers' enjoyment of the striped bass fishery

1 or consumption of the striped bass had to do with
2 lesions that were very abundant in the striped bass,
3 at least at that time, which we know now are
4 probably associated with exposure to certain kinds
5 of pollutants in the North Bay system.

6 In other words, water quality in the North
7 Bay system affected the usefulness of striped bass.
8 So if you produced -- even if you produced more
9 striped bass upstream, you still have that
10 limitation downstream. And, of course, San Pablo
11 Bay is crucial for migratory wading birds and diving
12 ducks.

13 Now, we're concentrating in the restoration
14 efforts so far on some of the anadromous fish and
15 some of the fish unique to Suisun Bay. But Suisun
16 Bay also has a large number of very important
17 species that range throughout the system.

18 It's interesting, and I think this is a
19 little bit of an overstatement, but it's interesting
20 what Herb (inaudible) said about the western Delta:
21 Supports very few species and very few individuals
22 compared to downstream.

23 That doesn't mean there aren't important
24 fish up there. It means that downstream we've got a
25 tremendously diverse community that is a part of

1 this system and tightly linked into the system.

2 So I'll end there and just again to make
3 the point that this is a full ecosystem. Ecosystem
4 restoration is really hard. We don't really
5 understand yet how to make -- how to bring back the
6 things that we've -- that we've damaged.

7 But we do understand that what happens in
8 one part of the system is highly dependent upon what
9 we do in the other parts of the system. And to draw
10 our boundaries too firmly and exclude San Francisco
11 Bay from the -- from the restoration efforts, and
12 especially the analysis of the implications of these
13 efforts, is from the viewpoint of most scientists I
14 know, pretty shortsighted.

15 CHAIRMAN MADIGAN: Cool. Very, very
16 cogent.

17 Pietro, I never really thought of your
18 salmon catch as nutritious carbon before, but it
19 works.

20 MR. PARRAVANO: Does change the
21 perspective a little bit.

22 MS. NOTTOFF: Our final speaker will be
23 to give us an idea of some of the solutions that we
24 think that CalFed should be pursuing that will help
25 us maximize our opportunities for doing some of the

1 type of restoration you've heard talked about.

2 MR. GLICK: I'm not talking about fish,
3 my apologies, or not, as the case may be. I've been
4 asked instead to talk about some work that we
5 recently completed looking at the CalFed water use
6 efficiency technical appendix. And what I'd like to
7 do is summarize some of the results that we came up
8 with in that work.

9 My name is Peter Glick (phonetic), I'm the
10 director of the Pacific Institute for Studies and
11 Development, Environment and Security here in
12 Oakland. We're a nonprofit research institute,
13 we're funded primarily by foundations. But the work
14 we did that I'm going to be discussing today, was
15 requested by the Department of the Interior by the
16 Bureau of Reclamation.

17 And I'd like to acknowledge my co-author,
18 Dana Haas (phonetic) in this work.

19 First of all, let me start by urging CalFed
20 to -- and BDAC in particular perhaps, to spend a
21 little more time than I'm possibly going to be able
22 to spend discussing this issue. There are some
23 technical issues here, there are methodological
24 issues, there are data issues, there are policy
25 issues. I have a very short period of time and it's

1 a very big problem and I urge you to spend more time
2 in the future thinking about them.

3 Second of all, I wanted to start by
4 thanking the CalFed staff during the process of
5 reviewing their technical appendix. They were very
6 patient with us as we worked our way through that
7 appendix. They're open to criticism and I have to
8 say we understand the difficulties that face them in
9 trying to evaluate the potential for water use
10 efficiency and demand management improvements in the
11 State of California.

12 Many of the errors that I'm going to talk
13 about are not the result of intentional
14 miscalculations. They're the result of the fact
15 that for a long time water use efficiency at the
16 state level has been underfunded, it's been ignored,
17 it's been misunderstood by a number of people
18 responsible at the state planning level for thinking
19 about these issues.

20 Because in part, many of the important data
21 aren't collected or if they are collected, they're
22 not made available to the right people. And also in
23 part because the individuals who tend to be
24 responsible for them then not to get the rewards and
25 attention that many in the more traditional water

1 supply planning areas receive.

2 I'd also like to note at the beginning that
3 a lot of progress has been made throughout the state
4 in water use efficiency improvements and
5 conservation. But I'll state at the beginning that
6 we are nowhere near the limits of what is
7 technically feasible, economically feasible or
8 socially acceptable, despite some of the comments
9 you may have heard from other people who disagree
10 with me.

11 I think this is true in all sectors. It's
12 in the urban sector. It's true in the agricultural
13 sector. It's true in residential, commercial,
14 industrial, municipal. It's true in all of the
15 sectors.

16 Furthermore, the potential exceeds what is
17 described as available in the CalFed water use
18 appendix. And that's what I'm going to talk about
19 specifically today.

20 Let me start by summarizing our
21 conclusions.

22 First of all, getting the numbers right is
23 critically important. The numbers affect estimates
24 of future demand, they affect the costs of
25 structural and nonstructural options and they affect

1 all of the modeling work.

2 There was some effort in the water use
3 efficiency component technical appendix to downplay
4 the importance of the numbers. To say, "Look, we
5 don't know what the numbers are but the truth is
6 they're not all that important. Let's implement as
7 much as we can and we'll go on from there. We'll
8 focus on supply reliability rather than this gap
9 between supply and demand projected by many of
10 the -- by the state water agencies."

11 I don't think that's correct. In fact, the
12 numbers themselves, the projections of future demand
13 and the potential for reducing that demand with
14 water use efficiency improvements affect directly
15 the modeling work that's done, it affects the impact
16 assessment that CalFed is doing, and it affects the
17 economic risk modeling efforts that are being done.
18 All of those numbers are in in the modeling efforts
19 and if we don't get the numbers right, then the
20 answers that come out of those modeling efforts are
21 also not right.

22 And my second conclusion is the numbers
23 aren't right yet. In particular, the CalFed water
24 use efficiency component technical appendix
25 underestimates substantially the potential for

1 cost-effective water use efficiency improvements in
2 all the sectors, in urban and agricultural sectors.

3 Now, having said that, there is no accurate
4 estimate of the true potential yet and there may
5 never be. There are a lot of uncertainties. I'm
6 going to describe some of the uncertainties. But
7 our assessment was limited to looking at the
8 assumptions and the numbers that went into the
9 technical appendix, and our conclusion is that
10 there's substantial problems with that that lead to
11 underestimates of the potential for cost-effective
12 improvements in water use efficiency. And I'll come
13 back with some specific examples later.

14 Among the problems are methodological
15 problems, which I'll touch on, computational
16 problems, which can be fixed, and then there are a
17 whole series of data that simply either have not
18 been collected or not been made available in this
19 analysis.

20 And I have to say right at the top, I
21 really believe the biggest problem is not with the
22 CalFed analysis but with some of the basic data that
23 they were forced to use that come from the
24 Department of Water Resources Draft DWR Bulletin
25 160. Which many of you know, if not all of you, is

1 the draft of the long-term California water plan on
2 which much of the California future estimates of
3 demand and supply are based. There are serious
4 flaws in those numbers.

5 CalFed staff worked very hard to try and
6 get around some of the more serious flaws that exist
7 there but not entirely successfully.

8 Finally, great uncertainties still remain.
9 The magnitude of the potential for conservation is
10 not any single number. It depends on water prices;
11 it depends on the design of rate structures and the
12 design of physical structures which you're wrestling
13 with; it depends on existing and developing
14 technology, some of which we know about and some of
15 which we don't know about; it depends on public
16 opinions and preferences and it depends on the
17 policies that water agencies and water managers
18 implement.

19 There is no single number for the potential
20 for demand management in California. It depends.
21 Because of that, and I want to emphasize this, there
22 is no single common program water efficiency number.
23 You cannot say that there is a certain amount of
24 water conservation potential and then that applies
25 to preferred Alternative 1 or 2 or 3 or whatever the

1 preferred alternative will be.

2 It's going to depend on the price, the cost
3 of those alternatives. It's going to depend on the
4 policies that are implemented.

5 Let me touch on some of the methodological
6 problems. I've already mentioned the first one.
7 There is no single estimate of the possible savings,
8 it depends on a lot of different things.

9 The second methodological problem I want to
10 address, and this is a pretty fundamental one, the
11 Department of Water Resources and CalFed tend to
12 treat water use efficiency as a supply option,
13 improvements in the efficiency with which we use
14 water conservation options, demand management
15 options, as the ability of those options to produce
16 new water, to produce supply. And that's the wrong
17 way to think about it.

18 Improvements in water use efficiency,
19 demand management are reductions in projections of
20 future demand. They're not -- they also sometimes I
21 would say produce new supply, real water as the term
22 is used sometimes incorrectly.

23 But the most important part of it is to
24 think about demand options as reducing future
25 demand. And I'll come back to this later. This one

1 problem alone reduces future demand estimates in
2 California by a million acre feet a -- more than a
3 million acre feet a year.

4 A third major methodological problem is
5 that economic principles in general are very
6 inadequately treated in the water use efficiency
7 technical component. There's very little attention
8 to the cost of water use efficiency improvements and
9 demand management options. Demand and supply tend
10 to be treated pretty much independently of costs and
11 prices and subsidies and market forces, and
12 therefore, they're unrealistically and incompletely
13 treated.

14 Where they are treated, in a very small
15 section of this appendix, the cost of conservation
16 options are mostly wrong. There's a single table
17 that comes from the Department of Water Resources.
18 It lists the demand management options ranging
19 between three or 400 and 1800 an acre foot.

20 Those numbers are widely agreed to be
21 inadequate. They look at a very small subset of the
22 data. And in particular, they reflect perhaps the
23 upper end of current estimates but not the lower
24 end. In some cases --

25 (End of tape)

1 -- the cost is zero. There is no cost to
2 improving the efficiency of certain kinds of water
3 uses.

4 And in our full report, which I should have
5 mentioned at the beginning was handed out, there are
6 a number of tables that describe demand management
7 option studies that have -- that list very large
8 numbers of improvements that are available at very
9 low cost or payback periods of under a year or
10 payback periods of one to five years. It depends on
11 what your assumptions are and what your desired
12 payback periods are.

13 But there needs to be a much more -- a much
14 better analysis of the cost of conservation options
15 than has been done so far. And the costs obviously
16 are critical to much of the rest of the problem. In
17 particular, since the cost of conservation options
18 is going to be compared quite directly with the cost
19 of supply options, and ought to be compared that
20 way.

21 Now, let me talk a little bit about some of
22 the data and information problems. And, again,
23 there's an enormous amount of information that's in
24 the full report that is not -- that I won't discuss
25 here, but I want to give you a flavor of some of the

1 major issues.

2 Again, I mentioned this first one, that the
3 technical appendix relied very heavily on the demand
4 analysis of the Draft DWR Bulletin 160 which has a
5 number of major methodological and data flaws, and
6 those flaws lead CalFed to underestimate the
7 potential for cost-effective efficiency improvements
8 in all sectors and to overestimate future demand for
9 water. And this 2020 demand for water is the
10 critical issue which I'll come back to again.

11 Again, I've said this but I want to
12 emphasize that these errors make a difference. The
13 numbers are very important for all of the modeling
14 that's gone on. In the matrices you saw this
15 morning, for example, you saw pluses for the common
16 programs of one and two in terms of their effect on
17 certain fisheries.

18 Those numbers, those pluses, those
19 decisions about what the relative benefits of the
20 common programs are, depend on, in part, the
21 assumptions for what 2020 demand for water is going
22 to be.

23 If we've got the 2020 demand for water
24 wrong, all of the modeling estimates for the costs,
25 for the -- where water is needed, when, how much

1 water is going to be able to be provided by the
2 existing systems, all of those are not going to be
3 right either.

4 The potential urban demand management
5 ignores many existing cost-effective technologies
6 and policies. I'll come back to a specific number
7 example in a moment.

8 Detailed residential end use studies in
9 California and in the rest of the United States
10 suggest that we can reduce indoor and outdoor urban
11 water use to well below the levels assumed even by
12 the more aggressive CalFed water use efficiency
13 assumptions. And I'll come back to a specific
14 number in a minute.

15 In addition, the potential for new and
16 developing technologies over the next 22 years,
17 between now and 2020, is excluded entirely. And if
18 you think back 22 years, you'll know that we're
19 going -- we're going to miss some things that are
20 happening.

21 In addition, the value and scope of
22 improvements in irrigation technology is under --
23 are underestimated. More quantitative analysis is
24 needed in the potential for decreases in,
25 separately, evaporative losses, transpiration

1 losses, reduced energy in economic costs of
2 overapplying water and improvements in water quality
3 from changes in agricultural water use. Again, the
4 full report has a lot of detail about this.

5 One of the critical issues is agricultural
6 water use is treated as evapotranspiration, as a
7 single unit. But there's a difference between
8 evaporation and transpiration and different water
9 use efficiency and conservation techniques and
10 policies applied separately to each of them, and
11 they need to be better treated in both cases.

12 Now, I said at the beginning that numbers
13 matter. Let me give you a couple of examples.

14 Reducing indoor residential water use in
15 the State of California by 2020 to 45 gallons per
16 capita per day would save an additional 530,000 acre
17 feet of urban water demand. That's just a number.

18 Now, it turns out that the American
19 Waterworks Association recently completed a massive
20 end-use -- residential end-use water survey. They
21 looked at thousands of homes. They metered very
22 carefully thousands of homes. They took literally
23 millions of measurements of individual water use,
24 and their conclusion was current indoor water use is
25 already below the level assumed in 2020 by DWR and

1 for today -- for 2020. Today it's below it.

2 And what they say is that we can reach 45
3 gallons per capita per day per person with five
4 existing well-understood conservation measures.
5 Today we can reduce indoor water use to 45 gallons
6 per capita per day with ultra low-flow toilets, with
7 horizontal access washing machines, fixing leaks,
8 and two others, and they're listed. And there's an
9 interesting table you should look at in the full
10 report.

11 So this is not a particularly aggressive
12 assumption. This again says no new technology,
13 unless you consider horizontal access washing
14 machines new technology, and I note they're going
15 out the door faster than the manufacturers can
16 produce them right now.

17 And specifically in that regard, an
18 estimate of replacing all vertical access washing
19 machines in California by horizon -- with the
20 existing generation, not new technology but the
21 current best horizontal access washing machine
22 available already on the market, would save between
23 170 and 200,000 acre feet of water in the urban
24 sector alone. Just an example.

25 Second, DWR's assumed current urban

1 baseline demand is too high and it's adopted by
2 CalFed which is why I raise it. And you heard a
3 little bit about this from the gentleman from Santa
4 Clara who observed that Santa Clara is today using
5 no more water than they used 20 years ago with a
6 much larger population, with a much more energetic
7 economic situation.

8 This is true of EBMUD, it's true of the
9 Metropolitan Water District. Basically, our
10 baseline has not changed very much in the last 10 or
11 15 years, but the baseline assumed by -- the current
12 baseline assumed by DWR is much higher than the
13 current baseline actually is.

14 This has been a subject of hearings by
15 Senator Johannssen's committee up in Sacramento.
16 It's a big -- a big question of -- it's a big issue
17 of discussion now with the California Research
18 Bureau which is looking into this issue. The
19 results of it are if you assume the wrong baseline
20 today, then what you're assuming for 2020 is also
21 incorrect.

22 If the baseline is too high today, then the
23 projected increment is too high. And our estimate
24 is that if you correct that, again you reduce 2020
25 demand by approximately a million acre feet a year.

1 A couple more examples.

2 Every time you save one percent in
3 irrigation efficiency in California you save on the
4 order of 300,000 acre feet of water. Some of this
5 water can be new water reallocable to somebody else,
6 some of it is improvements in water quality for
7 somebody else. It varies depending on where it is
8 and how it's saved.

9 But our estimate -- well, just to give you
10 one more example. A one and a half percent
11 reduction in current irrigation efficiency in
12 California saves more water than is estimated to be
13 saved by the current best management practice, the
14 voluntary best management practice that's being
15 adopted in agriculture.

16 And our estimate is that the potential for
17 saving -- the potential for improvements in
18 irrigation efficiency are many percent. Despite
19 some of the testimony that -- by the agricultural
20 community that we're already extremely efficient,
21 there is enormous potential for improving that
22 efficiency further.

23 In that regard, I acknowledge the efforts
24 that California agriculture has made in the areas of
25 precision irrigation over the last several decades,

1 but I'd like to point out that huge potential still
2 remains. And I think this potential exists both for
3 applied water and for new water savings which is a
4 distinction which I'd rather not get into with the
5 short time I have but which is described in this
6 whole report.

7 I'd like to note that even in 1991, which
8 was the last time a full statewide survey of this
9 was done, more than half of all California vineyards
10 were not using drip irrigation. More than 80
11 percent of orchards in California are not using drip
12 irrigation. And a sizable fraction of them are
13 still using flood irrigation, flood and furrow
14 irrigation, which leads to enormous unproductive
15 evaporative losses.

16 The same survey showed -- and I can
17 actually show you an overhead of this. This is a
18 survey of California irrigation technology in 1991
19 for field crops, vegetable crops, orchard crops and
20 vineyards showing what fraction are under drip which
21 is blue, sprinklers which is this pink color, and
22 surface irrigation which is yellow.

23 And you can see, as you might expect, that
24 as you head from field crops toward vineyards, the
25 more expensive permanent kinds of crops, you get

1 much more drip irrigation, much less surface
2 irrigation. But there is still 45 percent of
3 California vineyards that are using furrow and
4 surface irrigation techniques and still in orchards,
5 as I said, less than 10 percent or about 10 percent
6 of California orchards are on drip.

7 Not all of California orchards will ever be
8 on drip, or should be. Not all of them ought to be
9 not using furrow. But there's enormous potential
10 still for improving the efficiency of -- for
11 reducing evaporative, unproductive losses in
12 California agriculture. And I note there has not
13 been a statewide survey done since 1991 on this.
14 There have been additional improvements since then
15 but it's one of the data gaps that we still have.

16 You heard some testimony from Westlands
17 last time when you were in Fresno about how
18 efficient they've become, about the crop switching
19 that's occurred in Fres -- in the Westlands
20 irrigation district. All of that is true but I
21 would argue that there is still enormous potential
22 in Westlands as an example, not to -- not to isolate
23 them, as one example.

24 For example, they still use furrow flooding
25 or a combination of furrow with pre-irrigation with

1 sprinklers on 70 -- 76 percent of their irrigated
2 acreage. That's changed somewhat over the last
3 decade. 76 percent is the current number.
4 Precision drip irrigation is still used on less than
5 10 percent of their acreage.

6 Finally, let me make a couple of comments
7 about implementation. In recent years there's been
8 a change in the effort in water use efficiency and
9 demand management away from programs run by state
10 agencies towards the voluntary best management
11 practices both in the urban and the agricultural
12 areas. And I'm all in favor of voluntary programs.

13 But the truth is that the BMPs are only one
14 mechanism for achieving conservation potential. And
15 they're, in my opinion, woefully incomplete and
16 inadequate. They nowhere near touch the potential
17 that's available out there, the cost-effective
18 potential that's out there.

19 And in some ways, they per -- they get --
20 these BMPs have permitted state agencies to say,
21 "Okay, we're doing the voluntary things that we can
22 do" and not to do the other things that state
23 agencies should have a responsibility for doing.

24 In that regard, the water use efficiency
25 technical appendix, the component of CalFed, says:

1 "Implementation of efficiency measures will
2 occur mostly at the local and regional level by
3 local agencies, not by state and federal CalFed
4 agencies."

5 Now, to the extent that this is true,
6 CalFed should still develop guidelines and standards
7 for local and regional organizations to assist the
8 implementation of water use efficiency programs and
9 to help state agencies monitor those programs. But
10 it's not, I believe, entirely true. In fact, I
11 think there remains an extensive role and an
12 extensive responsibility for state and federal
13 agencies to do things related to water use
14 efficiency and conservation.

15 State and federal agencies can modify price
16 structures under their control. They can implement
17 technology standards or environmental standards that
18 are -- that make sense only at the state or federal
19 level, not at the local or regional level. They can
20 fund technological development and they can change
21 the rules that govern the water systems that state
22 and federal agencies operate.

23 State and federal agencies have the
24 responsibility to look at that side of the problem
25 as well, not just to devolve all of this to regional

1 and local government.

2 In addition, by ignoring these avenues for
3 implementation, we argue that the CalFed technical
4 use appendix underestimates not just the potential
5 for demand management improvements, but the
6 likelihood of implementing those improvements. And
7 that's an important factor as well.

8 My last overhead.

9 CalFed also emphasizes incentive-based
10 actions for demand management over regulatory
11 actions. And again, I have no particular problem
12 with that. I'm all in favor of incentive-based
13 actions. And in fact, one of the greatest barriers
14 to water use efficiency improvements is the
15 disincentive that the current price structure often
16 provides.

17 But limiting actions, implementing actions,
18 to those based on incentives alone reduces the
19 potential for a wide range of effective, potentially
20 effective water use efficiency programs and options.
21 It fragments policy-making and it rules out federal
22 and state actions that are valuable, effective and
23 more efficient than comparable local actions.

24 Examples of effective state or federal
25 actions include certification and labeling programs,

1 reductions in subsidies for inefficient water use
2 from government-owned or operated facilities and
3 large-scale programs for monitoring water quality.

4 In addition, I can't resist but point out
5 that the extensive supply options that have been the
6 focus of so much of the debate and discussions are
7 going to require federal and state funding. Why
8 assume that the water management programs for the
9 most part are only going to be -- only fall under
10 the purview of local and regional governments. That
11 seems to me an inconsistency, and when you couple
12 that with the fact that there are federal and state
13 programs that can be enormously effective, it seems
14 to me a serious inconsistency.

15 And, finally, let me note that --

16 MS. McPEAK: Peter, that's not the
17 assumption. Sorry, that's not -- that's not the
18 assumption. There's not the assumption that the
19 local government or regional level, and I actually
20 don't know what that means unless you have a very
21 large local agency, but there is not the built-in
22 assumption nor should there -- should we let that
23 pass without at least acknowledging that the demand
24 side is going to be funded only by local government.

25 MR. GLICK: Okay. I stand corrected.

1 Let me -- what I mean by that is the
2 emphasis in the water use efficiency technical
3 appendix is that most of the effort will be made at
4 the local and regional government level. I do
5 understand -- and I misspoke -- I do understand that
6 there is intended to be some water use efficiency
7 programs even within the CalFed process at the state
8 and federal levels.

9 MS. McPEAK: And a lot of funding.

10 MR. GLICK: But the greatest emphasis
11 for implementation for water use efficiency
12 improvements, as it's phrased in the water use
13 efficiency technical component, is for local and
14 regional activities.

15 Finally, let me just say one more thing,
16 and that is many of the people who refer to -- many
17 people refer to the focus on demand management and
18 water use efficiency issues as the soft path. Now,
19 the term "the soft path" was coined in the late '70s
20 in the energy debate, in the debate over, in
21 particular, building large new power plants in order
22 to address the energy issue. And many of the people
23 who refer to the soft path now in the water area, do
24 so in somewhat of a critical way.

25 And what I'd like to do is point out that

1 the soft path on the energy side ended up turning
2 out to be the right path and that it has saved
3 California in particular tens, if not hundreds of
4 billions of dollars by preventing the construction
5 of, and this is -- this was an estimate in one of
6 the Bulletin 160s I think done in the late '60s of
7 approximately 30 nuclear power plants that were
8 planned for the coastal areas of California. They
9 turned out not to be necessary from an energy point
10 of view and turned out more likely to be very
11 expensive from an economic point of view.

12 As it is, I note that some of the -- some
13 of our -- some California consumers, and everyone
14 who lives in the Bay area falls into this category,
15 is still paying very high rates for those few
16 nuclear power plants that actually were built at
17 that time. And I think the parallel between water
18 use efficiency and infrastructure and energy use
19 efficiency and infrastructure here should be pretty
20 obvious.

21 Then, as now, getting the numbers right is
22 important and being smart about implementation is a
23 key.

24 I thank you for your time. I'd be happy to
25 answer any questions if that's appropriate at this

1 point.

2 CHAIRMAN MADIGAN: Thank you.

3 Ann?

4 MS. NOTTOFF: I'm aware of the time
5 concerns here, it's up to the pleasure of the Chair,
6 but I did want to thank our presenters for very
7 informative and thoughtful presentations.

8 And I hope that BDAC will take away from
9 these presentations a recognition of the importance
10 of freshwater flows to the Bay-Delta ecosystem and
11 recognition of the hits that system has already
12 taken from diversions, as well as a sense of hope
13 that there are ways of improving water supply
14 reliability that do not require taking more water
15 out of the system.

16 And it's this phased approach I think that
17 we've talked about that I really think we should be
18 looking for in the -- make sure that that's very
19 clear in the framework agreement that's now under
20 review.

21 CHAIRMAN MADIGAN: Thank you. I do have
22 a couple of questions and I think we can take the
23 time for it.

24 Byron and then Alex.

25 MR. BUCK: Okay. My questions run

1 across a number of the panel presentations so I'll
2 take them in order, and I don't know if the
3 panelists FROM the first one are here, but just a
4 request on -- we got some graphs on some of the
5 fishing data and I had some questions on that.

6 One was showing annual commercial fishing
7 revenues 1988 and '98. '98 is not done yet so I
8 don't know if this is a fiscal year figure but it
9 would be nice to have the trend rather than just the
10 two data years. I understand last year was one of
11 the biggest revenue years around.

12 Also, it would be interesting to have
13 harvest rate data over times shown to BDAC. And
14 also on the second graph where we're looking at the
15 decline in permitted salmon fishing vessels, to have
16 the data that shows what the actual fishing power
17 out there is.

18 A lot of the smaller vessels have certainly
19 gone out of operation, but a lot of what's left,
20 from my understanding at least, Pacific Coast the
21 larger more efficient vessels. So simply to count
22 the decline in the number of vessels out there
23 doesn't necessarily indicate the level of fishing
24 power out there.

25 Dr. Luoma, is that right?

1 DR. LUOMA: Yes.

2 MR. BUCK: You mentioned the carbon
3 cycle a lot, and I'm wondering if USGS has looked at
4 the decline in carbon inputs that resulted from
5 going to secondary treatment throughout the Bay and
6 the Central Valley, which was perhaps an artificial
7 carbon input that made up for what happened when all
8 the reservoirs were put in. But that was a major
9 change pulling out 85 percent of the carbon that
10 would normally be coming --

11 DR. LUOMA: Well, that was at least one
12 time that was nutritious, wasn't it.

13 MR. BUCK: Yeah, it may have been
14 artificially supporting the system. I don't know if
15 any study's really been done on that, but we had a
16 major trend through the late '60s and through the
17 '70s and early '80s --

18 DR. LUOMA: Right.

19 MR. BUCK -- on going to secondary
20 treatment which took a lot of carbon out of the
21 system.

22 DR. LUOMA: I think Alan Jaspe
23 (phonetic) from U.C. Davis has done a study as best
24 can be done on all those different sources. That
25 source, even though it seems big to us, is small

1 relative to the natural cycle and much smaller than
2 the loss of carbon that occurred as a result of the
3 diking and development of the marshes.

4 So the marshes are a source that was lost
5 and this is also a source but is a very small one
6 compared to the natural carbon cycle.

7 MR. BUCK: And then on Peter's
8 presentation, just some perspective issues. I agree
9 with a lot of --

10 CHAIRMAN MADIGAN: Byron, let me invite
11 any other panelists who are still here to come on
12 back up to the table as well so that we can deal
13 with these questions expeditiously.

14 Or not.

15 (Laughter.)

16 Go ahead.

17 MR. BUCK: Okay. Just some perspective
18 issues on that. I agree with a lot of what's in his
19 report. We had similar -- CUWA had some similar
20 comments on Bulletin 160 that the institute had, but
21 just to point out that what we're really talking
22 about here is how much conservation will reduce the
23 increase in demands in the future.

24 And overall, we've got a supply gap right
25 now in dry years of about a million to two million

1 acre feet. We tend, I think, to forget that we've
2 had four wet years running and we haven't had any
3 shortages, dramatic ones, except for some of the
4 agricultural systems have had. And we needn't lose
5 that fact. As we're growing, we still have the
6 dry-year gap we've got to deal with, and how much we
7 can reduce that gap is really what we're talking
8 about.

9 Also, recently, certainly we've shown that
10 the urban areas' demands are fairly flat, again, for
11 wet years. Weather effects can have about a 14
12 percent swing in the average urban demand. So we
13 can consider what we're at today about seven percent
14 suppressed in a wet year over a normalized demand
15 and in a dry year you go seven percent the other
16 way.

17 So the demands we've had the last four
18 years, although flat, are somewhat masked again by
19 wet years because in wet years you've got lots of
20 local supply and you have lower irrigation demands
21 because a lot of your demands are being met by
22 nature.

23 The other effect of BMP putting them in,
24 and it's aggressively being done, is that they tend
25 to harden demands. You have less flexibility in the

1 drought. You can't put a low-flow toilet in twice.
2 Once you've done all the BMPs, your demand's pretty
3 hard and it's very hard to take much more shortage
4 from there without economic damage.

5 We agree, I think, with Peter that the
6 DWR's baseline, Bulletin 160 baseline for urban
7 demand is overestimated. The AWWA data does
8 certainly show that demands are already below some
9 of the projections because of what's going on.

10 Outdoor demand is another question
11 entirely. There is not a lot of good data out
12 there. A lot of contradictory data. Some data are
13 showing that, particularly in Southern California,
14 that a lot of people are deficit-irrigating and if
15 they irrigated efficiently their demand would
16 actually go up.

17 On the other hand, our experts that are
18 actually not theoreticians but are practitioners in
19 the field spending the \$50 million a year we're
20 spending on conservation, look at Bulletin 160's
21 projections for the techniques beyond BMPs and they
22 don't think that they will produce the savings that
23 DWR thinks they will.

24 So on the other hand, while we might --
25 might think their projections on current demands are

1 high, where we might go, there's disagreement on how
2 effective that's going to be.

3 Overall, though, the bottom line is we'd
4 agree that conservation is probably the single most
5 productive strategy we've got in terms of meeting
6 that gap between supply and demand.

7 Peter mentioned the five measures that were
8 studied in the AWWA indoor or end-use survey. All
9 those BMPs are being implemented here in California,
10 and again, \$50 million a year is being spent on
11 those. That's why the demands are down, because we
12 are doing these things. It's not a matter of can we
13 do them, it's not an argument, we're doing them.

14 These measures, though, aren't sufficient
15 in and of themselves and they're not necessarily
16 cheaper. I would agree that DWR or the Bulletin
17 didn't capture some of the cheaper ones that are
18 being done, and those are being done now. But I
19 know that Peter's report didn't disagree with the
20 upper bound estimate of some of the BMPs and what we
21 call the pre-BMPS that are well over a thousand
22 dollars an acre foot, and particularly CalFed's
23 number was \$1600 an acre foot. You asked for the
24 lower bound they put in but they didn't disagree
25 with the upper bound of \$1600 an acre foot.

1 That's very expensive water and if you
2 compare that against some of the more traditional
3 supply side options where we've got reservoirs
4 running in the range of 200 to \$400 an acre foot,
5 depending upon whose estimates you want to use,
6 that's still a pretty big gap.

7 And ultimately, what water districts do is
8 look at how to meet that demand in the most
9 cost-effective manner for their customers, and
10 they'll do what is economically the most feasible
11 first. And that's how the BMPs work. So a lot of
12 them that are 300, \$400 an acre foot are doing it
13 now.

14 A lot of recycling projects that are \$900
15 and \$1200 an acre foot are being built partly for
16 other reasons other than water supply. But there's
17 a lot of very expensive water being done or will be
18 done, but in and of itself, it's not the sole
19 solution we're going to have to incorporate.

20 CHAIRMAN MADIGAN: Thank you.

21 Alex.

22 MR. HILDEBRAND: I'll confine myself to
23 one brief comment and one question.

24 I found some of the things that Peter said
25 here to be persuasive but others not at all

1 persuasive, unfortunately. I'll ask him to exchange
2 cards with me so that I can debate it with him
3 without taking the time of this whole group.

4 I, too, believe that the Bulletin 160 is
5 flawed, at least in some degree, in the manners that
6 he suggests. But I think it is also flawed in other
7 respects that greatly underestimate the future
8 demands so that I think the net is an underestimate
9 rather than an overestimate.

10 But we'll work that out between the two of
11 us and if we don't resolve our differences, I may
12 write a little memorandum on the differences

13 CHAIRMAN MADIGAN: Oh, good.

14 (Laughter.)

15 MR. HILDEBRAND: My question is
16 regarding the circulation in the South Bay. Would
17 it not be helpful in respect to that circulation to
18 induce a tidally driven circulation by just hanging
19 flappers on the San Mateo Bridge so that
20 preferentially let the rising tide in one side and
21 the ebb tide out the other side?

22 {}: It's hard to respond to an
23 engineering suggestion like that, but I can say that
24 there have been a lot of engineering solutions
25 proposed for water bodies like this, and their

1 success rate's pretty small. I think something that
2 simplistic wouldn't have -- I mean just from my
3 initial reaction, but I -- would be that something
4 like that wouldn't have a lot of potential for
5 success. But I would -- you know, you might ask
6 some of the hydrodynamicists to get the specific
7 issue.

8 MR. HILDEBRAND: Wouldn't cost much to
9 try.

10 {?}: And it might have some negative
11 effects, too. Again, these things -- nature's
12 complicated.

13 CHAIRMAN MADIGAN: Peter, you're
14 entitled to a moment if you wish.

15 MR. CHADWICK: Thank you very much.

16 Someone said that making predictions is
17 very difficult, especially about the future. I
18 don't know what the future demand in California is
19 going to be. I think I have a little better sense
20 of it than DWR does, I'm embarrassed to say.

21 But the truth is it depends on -- our
22 future estimates of supply depend on our future
23 estimates of what -- of supply options of
24 infrastructure. It depends on what we think the
25 future demand is going to be. And there's serious

1 problems with our current way of estimating future
2 demands. And that's one of the things I was trying
3 to get at.

4 Byron, I agree with you entirely on the
5 issue of data, and particularly in the area, for
6 example, of outdoor landscaping. There's a section
7 in my written comments which I did not say today,
8 there are whole series of data gaps and there are
9 things we don't know that we ought to know. And
10 until we know them, it's going to be really
11 difficult to answer what future demand is going to
12 be, or even what the potential for current
13 improvements and future improvements are.

14 I disagree, though, about the BMPs. And,
15 in particular, they're extremely limited. The BMPs
16 address a very small fraction of the potential
17 improvements in conservation and, as you well know,
18 they're being implemented at very different rates.

19 For example, LEDWP has installed hundreds
20 of thousands, if not a million, ultra low-flow
21 toilets. Now EBMUD, my water district, which also
22 has not seen a big increase in water demand in the
23 last 20 years, has installed a few thousand or tens
24 of thousand at most.

25 Now, there's a big difference in the actual

1 current implementation of the BMPs. In terms of
2 economics, I don't want you to think that I agree
3 with the upper end of those numbers. I'm not sure
4 what the upper end is. I don't actually care about
5 the upper end. My concern is the lower end.

6 What's the potential for demand management
7 at zero dollars -- and there is some, fixing leaks,
8 for example -- what is it at \$100 an acre foot? If
9 you spend \$100 an acre foot or \$200 an acre foot,
10 what is the increment of conservation improvements
11 you get for different expenditures up to the point
12 where you're buying water transfer, where you're
13 getting -- you're spending money for water transfers
14 or you're buying an isolated Delta facility or
15 whatever.

16 Those are the kinds of comparisons we have
17 to make. And I'm concerned with the problems at the
18 bottom end.

19 CHAIRMAN MADIGAN: Thank you.

20 Sunne.

21 MS. McPEAK: It's hard to know where to
22 begin on responding. Yesterday, Martha and I had a
23 little bit of a discussion and I said I actually
24 don't care about the numbers. I care a lot about
25 numbers when they matter, when they're actually

1 going to drive a decision.

2 My approach on the CalFed challenge is that
3 we're actually not sitting here attempting to meet
4 California's water needs. We're sitting here trying
5 to fix the Bay-Delta estuary.

6 Now, I care about those numbers in terms of
7 our performance standards, what we're going to take
8 as success when we restore the estuary. But I sort
9 of made a little bit of a career out of dispelling
10 the projections in Bulletin 160 15 years ago.
11 They're a little better today, but actually they
12 don't matter in my opinion for what we're doing in
13 this arena.

14 I want to -- I want to just elaborate. We
15 could have a long discussion. They should not
16 matter because of the following: It should be our
17 commitment, and it is certainly the position of the
18 people I represent, that we want absolute maximum
19 efficiency from the current supply.

20 Now, what we should argue about is how to
21 do that and what that means. And in fact, I have
22 some pretty interesting discussions with my own
23 members over are we going to do that at any cost.
24 And we have sort of reached a compromise of using
25 the word not maximize but optimize.

1 But it would be at a pretty high level
2 before we would, I think, back off and say that's
3 not optimizing the demand management or efficiency
4 because we also embrace another notion which we call
5 a water ethic that we just don't want to do any more
6 development than is necessary. It's simply a matter
7 of commitment to the environment.

8 So I think the Bulletin 160 numbers are
9 interesting, maybe they're wrong, they probably are
10 high, but it almost should not be a matter of
11 anything in this process except for the evaluation
12 in the EIR/EIS, not driving a policy decision about
13 do we choose demand management or efficient water
14 use over construction.

15 We have to optimize, in our opinion, the
16 current use of the existing supply, or the use of
17 the current supply.

18 And so I would hope that -- at least that's
19 my approach, and maybe, Lester, you can comment on
20 this -- we could avoid so much debate over the
21 demand numbers or the per capita consumption but
22 rather over the efficiency that -- the efficient
23 measures and how we get to that efficiency in this
24 arena.

25 Because the actions that would be in that

1 framework would be more about what is going to be
2 done at the local level, and by the way, not just at
3 the local level. We would argue for, have commented
4 on, have suggested and would look for in a final
5 framework, very significant carrots, carrots big
6 enough to be sticks, and sanctions for implementing
7 the most efficient water use in that there's no
8 access to additional water supply.

9 We've even suggested before the State Water
10 Resources Control Board that it be taken into
11 account in water rights proceedings. Those are
12 fairly significant kinds of measures. You can amend
13 bond covenants. There's a whole lot of other things
14 that would be done at a statewide level or at a
15 higher level than local to encourage, reinforce,
16 reward those actions that we say have to be
17 implemented locally.

18 Because I don't really envision the state
19 coming in and putting toilets -- new toilets in
20 everyone's home. I do see that as being the
21 responsibility of a local level.

22 So, could you, Lester, comment -- are you
23 on the same page that I am or am I just out to lunch
24 on this one?

25 (Laughter.)

1 MS. McPEAK: And if we're -- if we're
2 close -- they all want to get out to lunch.

3 CHAIRMAN MADIGAN: Think about your
4 answer here.

5 MS. McPEAK: Yeah. And if -- and if we
6 are close, if you think that what I've just said
7 represents the spirit of how you're approaching
8 this, then how are -- how do you think we're going
9 to better convey what we're about and not have this
10 interminable argument over their numbers on
11 consumption?

12 MR. CHADWICK: Can I --

13 EXECUTIVE DIRECTOR SNOW: Yes. Okay,
14 then I can think of my answer.

15 MR. CHADWICK: Lester, it will give you
16 a chance to --

17 CHAIRMAN MADIGAN: Go ahead.

18 MR. CHADWICK -- gather your wits.

19 I agree in fact that is the page they're
20 on. I think yes is the right answer, Lester, and
21 you are thinking about this the same way. And I
22 would love it if this were not a debate about the
23 numbers. But I want to say one more time why the
24 numbers are important.

25 I would rather this not be a debate about

1 the numb -- the potential and about DWR.

2 MS. McPEAK: And I understand the
3 modeling. I understand what you said, that the
4 modeling is all based on those assumptions.

5 MR. CHADWICK: The modeling for how much
6 water needs to be delivered where and when, the
7 modeling assumptions for where the flows are going
8 to be over the next two decades, depend
9 fundamentally on the assumptions put into them about
10 future demand for water.

11 And if the demand for water in the future
12 is overestimated, either because of a methodological
13 problem or a number problem or whatever, then the
14 modeling numbers and the costs of options, the
15 economic risk model work, the DWR work, is all going
16 to be wrong.

17 The numbers are fundamental here and we --

18 MS. McPEAK: I even accept that, Peter.
19 I even accept that, accept the numbers that are more
20 important than with respect to the fish. And I want
21 to ask Zeke a question, really is where -- how much
22 water went for the fish?

23 That's actually -- those are actually very
24 important numbers as far as I'm concerned. And we
25 have a pretty simple way of proving whether or not

1 some of these facilities are going to be needed.
2 We're going to have to work like hell to get this --
3 all these BMPs implemented and then people either
4 put up money for facilities or they don't.

5 I mean, as we go forward, we have a new
6 paradigm on how we're funding facilities. I -- I
7 actually think that that would be a pretty
8 interesting way of getting -- getting to the core of
9 how valuable are certain actions, and you couple
10 that with an expanded water market, and we're home
11 there.

12 I mean, that's very simple-minded, I
13 understand how I just -- you know, that I laid it
14 out in that way. But there are certain numbers I
15 think that are important. The modeling by and large
16 that's been done is ignoring the most fundamental
17 number, which is how much water went for the fish.
18 Not where are we likely to see inputs because of
19 demand.

20 That's my comment.

21 Zeke, what happens, when is it that you see
22 the real stress on the fisheries. I mean low
23 rainfall, but how long did the fisheries tolerate
24 it?

25 MR. GRADER: Let me just go through.

1 Generally, unlike an agricultural crop where you see
2 the impact that year, for us in fisheries there's a
3 three-year delay, generally three to four years.
4 That's the maturation rate of the fish when they
5 become available for harvest.

6 So, for example, following the '82-'83
7 El Nino and the very wet years that followed that,
8 going on up through the spring of '86, we had a
9 record or near record production beginning in '86,
10 '87, '88. '88 was the best year ever for our ocean
11 fishery. And that's because we had very good water
12 conditions.

13 At the same time, we were warning in '87
14 and '88 that the fisheries were going to start to
15 take a decline, which in fact they did. And we saw
16 that particularly in 1991 when we fell from -- down
17 to 1.5 million acre feet.

18 Now, there are those that would like to
19 say, "Well, there must have been too much fishing
20 effort" or this or that. I should point out that
21 during '87 and '88, during those record years, we
22 also met or exceeded the spawning escapement goals,
23 the number of fish we needed to get back for optimum
24 escapement. And that's been ongoing.

25 What we had last year, which Mr. Buck was

1 saying we had a record year last year, we didn't
2 have a record year last year. We had treble the
3 amount of fish we had for optimum spawning
4 escapement mostly because of other restrictions that
5 were placed on the fisheries. In other words, the
6 fishery has been restricted but we've had the number
7 of fish getting back.

8 Now, I know there are a lot of people that
9 want to deny that. People denied the holocaust too,
10 but that don't make it so, you know, that it didn't
11 happen. And that's the problem.

12 Those figures are out there and it's pretty
13 clear, and people want to keep skirting around it,
14 when you add water to the mixture, when you have
15 water in those rivers and through the Delta, fish
16 production is good. When you don't have it there,
17 fish production goes down.

18 Now, that's not absolute. This year
19 obviously we're -- we're seeing the impact of the
20 El Nino. This otherwise should have been a good
21 year. What we're seeing right now is the numbers
22 are down somewhat and the fish appear to be
23 stressed. That's because of an oceanic condition.
24 But absent an El Nino, that's generally the trend.
25 And it's not just in the Central Valley system. We

1 see it in the Klamath Trinity system as well.

2 MS. McPEAK: And then what is the
3 recovery time? Is it also a three-year delay?

4 MR. GRADER: It's roughly that so -- and
5 that's what we saw. The fish we saw coming back
6 last year where we came off a wet year. The year
7 prior to that, they came off a dry year, production
8 was down. The year before that, they came off a wet
9 year and the production had been up. Generally, you
10 know, tracing it back three years, generally we're
11 looking at harvesting three -- primarily three-year
12 old fish and some four-year-olds. And that's the
13 trend.

14 Now, I should say that people ask, "Well,
15 what about the fishing power, hasn't that
16 increased?" Fishing power's gone down because,
17 frankly, most of the people that had to rely on
18 fishing full-time, not just as their summer, if they
19 were schoolteachers or whatever fishing during the
20 summer, have had to go into other fisheries because
21 they couldn't rely on salmon.

22 So in fact, most of the vessels we're
23 having are the smaller vessels that are less
24 effective than the -- certainly the hardest index
25 has gone down. That is power -- how they measure

1 the effectiveness of a vessel out there and the
2 trend has been down. It's clear that the numbers
3 are there. And, frankly, I don't know why we're
4 still debating that except we're still debating the
5 holocaust, too, with people.

6 You know, the numbers are there. It's
7 clear. And the problem is is that there's just a
8 certain element in our society that doesn't want to
9 acknowledge what in fact is happening.

10 CHAIRMAN MADIGAN: Thank you.

11 I have Roberta, then Alex and then those
12 are the last two.

13 Lester, did you want to expand on your
14 earlier comment?

15 You do.

16 EXECUTIVE DIRECTOR SNOW: Yes.

17 CHAIRMAN MADIGAN: Sure, do that now.
18 Go ahead. You've had a chance here to think about
19 it.

20 EXECUTIVE DIRECTOR SNOW: Yes, I agree.

21 CHAIRMAN MADIGAN: Okay, that is an
22 expanded answer.

23 (Laughter.)

24 EXECUTIVE DIRECTOR SNOW: No, I don't
25 want to be too flippant about it. But I think the

1 way that Sunne described it is the way that we've
2 tried to structure this issue, and I think -- I
3 think there's one area that we all agree on: All
4 projections are wrong. I mean, that's just the way
5 that they work out. There is not a projection that
6 ever comes out right on the money.

7 And I think the issue, maybe it's where I
8 have some disagreement with the way that Peter would
9 characterize it, I think we can look at different
10 demand levels. We've attempted to do that and it's
11 probably -- certainly not clear in some of the stuff
12 that we've laid out.

13 I think we're finding, particularly the way
14 that we're going with developing a preferred
15 alternative and starting to apply principles of
16 adaptive management to storage and conveyance, that
17 the way you approach this, your preferred
18 alternative is getting to be relatively insensitive
19 to changes in future demand of a million, million
20 and a half, maybe even two million acre feet in
21 terms of how you're going to set forth to correct
22 the problem.

23 That's not a statement to be an excuse to
24 not try to get the best projections that we can get.
25 It's just questioning how sensitive this approach

1 that we're developing is to those 2020 numbers,
2 particularly when you start applying adaptive
3 management to storage and conveyance.

4 CHAIRMAN MADIGAN: Thank you.

5 Roberta?

6 MS. BORGONOVO: To go back to the first
7 discussion we had yesterday, and that is, what would
8 happen to all the comments that came in. What I
9 heard Peter and Zeke and Sam doing is adding to our
10 knowledge of the way in which we approach the
11 problem.

12 So I think it's very important that those
13 perspectives be incorporated and that CalFed's new
14 preferred alternative take into account some of the
15 discrepancies or lacks of knowledge that were there
16 when the initial EIR/EIS was done.

17 CHAIRMAN MADIGAN: Thank you.

18 Alex?

19 MR. HILDEBRAND: I agree with Peter. I
20 think the numbers are important even though they're
21 very difficult to arrive at. You can't divorce the
22 question of taking care of all these things we're
23 talking about in the estuary from the question of
24 the inflow of the estuary. And that relates to the
25 demand.

1 We've had a whole parade of panels here
2 this weekend and every one of them has bragged about
3 how efficient they are, but everybody wants more
4 water. And, you know, Santa Clara wants 50,000 more
5 acre feet to be taken from agriculture in a dry
6 year, and you can talk to any one of these urban
7 organizations and they'd tell you how great they are
8 in efficiency, but they all want -- are all planning
9 to take more agricultural water away from the growth
10 of food to produce something else.

11 We need more water for the fish downstream.
12 We need more --

13 (End of tape)

14 MR. HILDEBRAND: You can't do all those
15 things if you don't have the water. And the amount
16 of water you have available to do them depends on
17 the inflow to the Delta. So you do have to look at
18 the demand.

19 Now, I differ from Peter in that I think
20 the Bulletin 160 is in error, if you look at it in
21 aggregate, in that I think that they're low in their
22 demand figures whereas he thinks they're high. I
23 think that there's a balance here. Some things are
24 low and some are high. But we can argue about that
25 later.

1 But I just can't see how you can say that
2 the overall water supply doesn't have to match the
3 demand somehow or other. It's got to or it won't
4 work. We can't reach these environmental goals if
5 we don't have the water. And if the environment has
6 to compete with the motherhood stuff and the food
7 and so forth, it isn't going to win out. If we want
8 to save the environment, we've got to have enough
9 water to do it.

10 CHAIRMAN MADIGAN: Thank you.

11 Martha.

12 MS. DAVIS: I realize this is not an
13 easy discussion to have, particularly raising some
14 of these questions about baseline issues that go to
15 the heart of the EIR/EIS analysis and the
16 implications of how much -- how well we understand
17 both the definition of the problem that we're trying
18 to solve and what a reasonable investment that we
19 need to make in our future to solve those problems.

20 I think the concern that I've got is that
21 as I look at the package of things that need to be
22 part of this preferred alternative, we're also
23 talking about ultimately a certified EIR/EIS and
24 environmental impacts that will -- statements and
25 documentation that will tier off the assumptions

1 that are contained in this analysis.

2 And so as difficult as this discussion is,
3 it's an important to have because the numbers count.
4 They count now and they count 20 years from now in
5 terms of the overall issues that we're facing.

6 I strongly support the statement made by
7 Elise this morning that we do need to take very
8 seriously what we can do for everybody to try and
9 make the Bay-Delta work now, to try and work around
10 the current situation so that we're not making
11 things worse. And that's looking at everybody
12 together.

13 I think we also need to be thinking about
14 how we can craft this interim plan and the preferred
15 alternative. And I think you're right, Sunne, in
16 terms of looking at conservation programs and things
17 like that, I am far more interested in just doing it
18 and not arguing about numbers near-term or
19 long-term.

20 But I think that we somehow have to find a
21 way to piece this together so that we can have a
22 preferred alternative and an interim plan that
23 allows us to move forward with all of the commitment
24 that we've brought to this table that still
25 acknowledges that there may be some parts of the

1 EIR/EIS analysis that have to be untangled in order
2 to have a document that can be appropriately
3 certified at the end of this process.

4 MS. McPEAK: And not go through
5 litigation, I stipulate to that.

6 CHAIRMAN MADIGAN: Thank you.

7 Brian.

8 RYAN: Thank you, Mr. Chairman, I'll try to
9 be brief on two quick points.

10 First, I think the issue that's been raised
11 by both the commercial and recreational fishing
12 interest as underscores what we've discussed for the
13 last two days, try to maintain a balance of
14 beneficial uses whether they relate to urban or ag
15 supply, recreation is a beneficial use of water. It
16 is an issue that folks have paid a tariff on in the
17 commercial and recreational side of the equation
18 since 1911, I believe, on the fishing licenses and
19 on landing taxes from the commercial perspective.

20 The folks that participate in the
21 recreational fishery are kind of providing a
22 day-to-day pulse on the health issues that we talked
23 about in terms of establishing, you know, the flows,
24 whether it be the carbon, whether it be the
25 phytoplankton, the restoration processes on tidal

1 marshes.

2 And it may not come to the basic
3 necessities that we are debating here as it relates
4 to do we have food for our tables, do we have basic
5 water for health and safety, but it does come to the
6 issue of once all those are met, does your soul feel
7 good in the afterhours.

8 And the other issues with respect to the
9 tidal -- the tidal wetlands issues, \$20 million over
10 20 years to try to establish form and function in an
11 environmental study that allows for the protection
12 of a whole variety of species is absolutely a
13 critical issue.

14 But, please, let's not lose -- lose sight
15 of the fact, as Nancy Schaefer referenced, the new
16 gate going in the Shell Marsh -- and, Sunne, I think
17 you and I both remember a time when there was three
18 feet of oil in that marsh -- that those -- that
19 expanse of acreage is going to require not just the
20 purchase and abandonment, but the purchase and the
21 management and the care.

22 And that is a long-term, long-standing
23 operations and maintenance issue, on two issues:
24 Maintaining the form and the function and providing
25 the interpretation so that when folks visit that

1 marsh and see what has been invested in it, that
2 they can relate to it as a benefit, just as they do
3 when they turn the tap on and they get water, just
4 as they do when they can eat some good corn out of
5 the Delta.

6 So in summary, that's it.

7 MR. GRADER: Ryan, let me if I can, just
8 state one thing, though, which is a little bit
9 troubling to me what you just said. You talked
10 about the fisheries as being recreational. First of
11 all --

12 RYAN: I referenced commercial, too,
13 Zeke.

14 MR. GRADER: Yeah, but keep in mind, and
15 I think people tend to forget this in all the
16 debate, is that we fed the miners when they came
17 here, the '49ers, in 1849 and '50, we fed them
18 primarily with salmon. That's how our salmon
19 fishery got started. That is food. Don't ever
20 forget that that is food.

21 And from the recreational standpoint, those
22 people aren't just going out there having something
23 to kill. The salmon's not a mountain lion where,
24 you know, you get off on showing you're macho by
25 killing an animal. Generally, they're eating them.

1 So there is a benefit there, too, from it.

2 So don't ever, ever forget that that fish
3 is food. In fact, that was our fish -- first big
4 crop here in California with the coming of the white
5 man.

6 CHAIRMAN MADIGAN: Thank you.

7 I have -- Sunne.

8 MS. McPEAK: A question on -- on the
9 wetlands, the -- that Ryan triggers based on Nancy's
10 presentation, which that is excellent work and for
11 the record, right after saving this estuary, the
12 highest environmental challenge we see in the Bay
13 area is the restoration of wetlands and getting them
14 back to something that is on the magnitude of what
15 we originally had.

16 But the -- but I don't know, Lester, and I
17 don't know that it's been well pieced out in our
18 work is the relationship of those wetlands to the
19 ecosystem by ability of the fisheries, which is one
20 of the leading indicators. And we have an argument
21 in the Bay area about whether or not it too should
22 be funded all here. We're prepared to fund -- I
23 mean, we're prepared to support funding of it. We
24 don't know if that should be -- what portion of it
25 should be in terms of wrapped into CalFed.

1 So Eric's holding his head, he can tackle
2 that one, too, in the finance committee.

3 But do we know, in terms of the biological
4 connections there, how much would really -- should
5 be incorporated into the CalFed project and how much
6 of that should be done perhaps as part of a
7 regional -- another regional funding package?

8 EXECUTIVE DIRECTOR SNOW: Yeah.
9 Actually, the round table process, the current money
10 we have access to, the Bay is eligible to submit,
11 they must show a connection to the problems in the
12 Bay-Delta system, and we have, of course, funded
13 North Bay projects.

14 MS. McPEAK: Right.

15 EXECUTIVE DIRECTOR SNOW: And I think
16 the most direct answer to your question is that it
17 clearly has established that corridor, particularly
18 for salmon, all the way through the system. And so
19 you can envision an enhanced corridor in -- along
20 the Sacramento River, in the Delta, Suisun, North
21 Bay, as they migrate out, the kind of habitat that's
22 necessary for that.

23 MS. McPEAK: In South Bay, somebody has
24 to demonstrate the connection, is that it?

25 EXECUTIVE DIRECTOR SNOW: Correct. I

1 mean, actually -- literally, the way that the South
2 Bay is included in a program that's very similar to
3 the way we've included the Sierra Nevada in terms of
4 the watershed-management based approach.

5 CHAIRMAN MADIGAN: All right. Thank
6 you.

7 We have two speaker slips. Thank you very
8 much, panel, I appreciate it. You hung in here a
9 long time. You've given us a lot to think about and
10 we're very grateful for that.

11 The first speaker slip is from Peter
12 Grinell (phonetic), General Manager of the San Mateo
13 County Water District.

14 Good afternoon, sir, thank you for your
15 patience.

16 MR. GRINELL: Good afternoon. Thank
17 you. It -- I need to make a slight correction.
18 It's the San Mateo County Harbor District. And
19 I'm --

20 CHAIRMAN MADIGAN: Sorry about that.
21 Talk about --

22 MR. GRINELL: No problem.

23 I'm here to put in a word about fish and
24 money. I would like you to expand your perspective
25 to consider as you grapple with the issues of how to

1 fix the Bay and Delta, and whatever the impacts of
2 vehicle tax on continuing the (inaudible) shift are
3 on your abilities to accomplish anything, to
4 consider the following impacts of a decline in major
5 salmon fishery in particular and others as a result
6 of problems within the Bay and Delta system.

7 First of all, lower catches, lower
8 abilities for the fishing fleet, a great segment of
9 which operates out of our Pillar Point Harbor at
10 Half Moon Bay, has the following economic impacts:

11 Not only not do the individual fishermen
12 themselves sustain direct impacts in terms of no
13 income and increased liability on their ability to
14 pay off the considerable capital investments they
15 have in their vessels and the equipment, but there
16 are other factors as well that affect, for example,
17 the state budget and the state fiscal condition.

18 Our harbor and most of the harbors on the
19 coast have significant debt to the State of
20 California through the Department of Boating
21 Waterways which financed the construction of those
22 facilities. Our ability to pay off those loans is
23 directly related to our ability to gain revenue
24 primarily from berthing fees.

25 In our harbor, the major segment is the

1 commercial fishing fleet. Fishermen don't work,
2 they don't pay their berthing fees. We send them
3 30, 60 and 90-day notices, put their boats on lien
4 sale if we have to. That's the law.

5 We cannot pay off our debts. We're sitting
6 under a three-year moratorium right now with the
7 department in our ability to pay off these debts.
8 That has a direct bearing on the state's budget and
9 the state's available funding for various kinds of
10 things, including fixing the Bay-Delta.

11 Second, there are direct implications
12 negative on our harbor facilities, which are public
13 facilities. Deferred maintenance, our ability to
14 keep the docks operating and safe for the public.
15 In fact, we are considering now a complete
16 inspection of our facilities to identify and rank
17 those repair items that we must attend to.
18 Otherwise, our insurance rates go up.

19 There are safety problems as well relating
20 to these facility concerns. Again, to the extent
21 that the fishermen cannot operate, cannot catch
22 fish, there are significant economic impacts and
23 employment impacts, all negative, on the local and
24 regional economies.

25 The commercial fishing industry -- I'm not

1 sure you're aware of this -- has among the highest
2 employment multipliers of any industrial sector.
3 Directly off the boats, it's roughly three to one.
4 Every fisherman on a boat generates up to three
5 other jobs. If you include the on-shore handling,
6 processing and distribution facilities, the
7 employment multiplier is up to as much as eight to
8 one. That relates to cooks and waiters in
9 restaurants, salespeople in the supermarkets.

10 There is therefore a very extensive spread
11 effect, adverse, when you do not have a healthy
12 fishing industry. And, essentially, the burden of
13 my statement here, which I will now draw to a close,
14 is that there is a direct bearing on these
15 considerations in what you do with the Bay-Delta
16 system. Because that has a direct implication, as
17 Mr. Grader has indicated, on particularly the salmon
18 fishery, which is the major north and central coast
19 fishery.

20 And so I ask you to bear that in mind and
21 consider how, in your various alternative
22 deliberations, you can come up with mechanisms that
23 will in fact address that issue.

24 Thanks.

25 CHAIRMAN MADIGAN: Thank you, sir.

1 Thanks again for your patience.

2 Michael Warburton (phonetic).

3 Mr. Warburton, good afternoon.

4 MR. WARBURTON: Thank you.

5 I'm thinking that I'm very encouraged by
6 the entire CalFed process to give attention to
7 environmental restoration, and in the process I
8 think numbers do count.

9 One thing which hasn't had any numbers are
10 some impacts on public trust values and resources in
11 the State of California. It hasn't been part of the
12 discussion, but parts of Zeke Grader's account of
13 the impacts on fisheries really struck an echo in my
14 mind because there is a California public trust
15 interest in fisheries and wildlife. And I don't
16 feel it's been either quantified or assessed by the
17 CalFed process.

18 And as resources and ecosystems decline, I
19 think the base numbers for wetlands and fisheries
20 are closely related to an understanding of what the
21 California public trust interest might be in its
22 ecosystems. And also as a citizen, while different
23 options for water supply are being considered, I'm
24 concerned that California citizens might be put in
25 the position of actually buying back their own

1 public trust. And I think this is a situation which
2 CalFed hasn't adequately assessed.

3 In any case, as a California citizen, I'd
4 like to see some sort of attempt to take a look at
5 what the public trust might mean to this. It's part
6 of California law. It's been largely forgotten by
7 the courts and it's a dangerous place even to bring
8 it up in the courts, but I think it should be part
9 of the public discussion of this CalFed process.

10 Thanks.

11 CHAIRMAN MADIGAN: Thank you, sir.

12 That's all the speaker slips I have.
13 Congratulations to the survivors. Thank you all for
14 your interest and attendance. We're adjourned.

15 Oh, next meeting September 10th and 11th in
16 Stockton. See you all there.

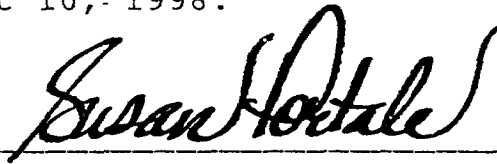

17 (The meeting adjourned)

This is to certify that I, SUSAN PORTALE,
transcribed the tape recorded meeting of Bay-Delta
Advisory Council Meeting, taken on July 17, 1998,
fully and correctly to the best of my ability; and
that the pages numbered 1 through 206 constitute said
transcription; that the same is a true and correct
transcription of the tape recorded interview of the
aforesaid, to the best of my ability.

Dated August 10,- 1998.

A handwritten signature in cursive script, reading "Susan Portale", is written over a horizontal line.
